## Rapport sur les résultats de la campagne d'échantillonnage de till de la région de Red Lake.

### Sommaire des travaux et résultats

Environ 600 échantillons de till de surface ont été collectés au nord du camp minier de Red Lake dans l'ouest de l'Ontario. Les échantillons de 3 kg ont été analysés pour l'or et autres éléments associés aux métaux économiques dans la matrice du till, tandis qu'une cinquantaine d'échantillons de 10 kg pour l'or visible dans l'échantillon total (*bulk*).

Le secteur d'étude se prête particulièrement bien à l'exploration glacio-sédimentaire, la majeure partie des roches vertes étant disposées dans une axe nord-ouest-sud-est, donc perpendiculaire l'écoulement glaciaire régionale qui est vers le sud-ouest. Le design d'échantillonnage a été effectué de façon à optimiser les résultats de prospection; les échantillons ont été stratégiquement collectés, la plupart étant localisés en aval glaciaire de ces roches potentiellement porteuses d'or.

Les résultats d'analyses pour les tills de 3 kg montrent globalement de faibles teneurs en or. La majorité des tills (>400 échantillons) affichent des valeurs de 2 ppb et moins, des valeurs tout juste au-dessus de la limite de détection. L'argent et l'arsenic montrent sensiblement le même patron de teneurs faibles. Les résultats des analyses pour les tills de 10 kg pour l'or visible indiquent que seulement un échantillon contient des grains d'or, soit 2 grains.

Il faut cependant noter une exception à cette distribution de faibles valeurs. Dans la partie sud de la zone échantillonnée, un échantillon montre une teneur de 440 ppb en or de même que des teneurs en cuivre nettement supérieur aux valeurs régionales. Autre aspect intéressant, trois autres échantillons de ce secteur montrent également des valeurs en or au-dessus du background régional. Ces échantillons sont de plus disposés dans le même axe de dispersion glaciaire que l'échantillon montrant une anomalie de 440 ppb. Deux autres échantillons de ce secteur montrent aussi des valeurs élevées en cuivre.

### Interprétation des résultats

À l'exception d'un secteur (qui sera discuté en détail plus bas), les très faibles teneurs en or obtenus pour les tills de la région échantillonnée suggèrent *a priori* que les roches vertes de cette région ne sont pas porteuse d'une grande quantité d'or, du moins d'un point de vue économique. Cependant, ces résultats pourraient être reliés à d'autres facteurs, entre autres la qualité des tills échantillonnés et/ou l'environnement quaternaire.

En effet, les dépôts glaciaires (tills, eskers) de la région échantillonnée ont été affectés par la présence d'un lac glaciaire (Lac Agassiz) qui a recouvert l'ensemble du territoire au cours de la déglaciation. Les eaux de ce lac peuvent potentiellement avoir remaniés le matériel de surface, causant de ce fait une dilution des valeurs en or des tills en remaniant la matrice de ces tills et causant ainsi la dispersion des métaux lourds dans l'environnement glaciolacustre. Tel que discuté antérieurement avec le géologue en charge de ce projet (L. Eustache), ce

phénomène de remaniement peut être potentiellement contourné en orientant l'échantillonnage de façon minutieuse, i.e. en collectant l'échantillon de till à grande profondeur afin d'éviter la zone remaniée par les vagues et en favorisant l'échantillonnage du till dans les zones montrant une topographie élevée, à l'aval de pitons rocheux (c.f. sketch de Henderson, P.J., 1994).

Les notes de terrain relié à l'échantillonnage, de même que la carte montrant la distribution des échantillons sur les photos aériennes et la topographie, semblent suggérer que cette consigne a été respectée. Les notes font mention de la présence de clastes dans la plupart des échantillons collectés. Par contre on retrouve toute de même de nombreux échantillons avec des caractéristiques suggérant l'influence du remaniement lacustre (ex. : beaucoup de sables silts, peu de clastes, ou encore carrément des échantillons glaciolacustres). Par ailleurs, une proportion importante d'échantillons a été caractérisée 'melt-out' till. Théoriquement, un melt-out till se retrouve en région où la déglaciation se fait avec une glace stagnante, ce qui est opposé à la région d'étude où le retrait glaciaire était plutôt actif, avec un recul au contact d'un lac glaciaire et formation de nombreuses moraines mineures (moraine de De Geer). Par contre, les autres caractéristiques qui accompagnent souvent les échantillons dénotés comme melt-out till sont '... contenant beaucoup de clastes et de graviers...'. Ces caractéristiques sont typiques d'un till ayant subit un délavage de ses particules plus fines par l'action des vagues. Dans ce cas-ci, il n'est donc pas surprenant de voir des faibles teneurs en or dans ce type matériel, car la fraction même où se trouve l'or pour les analyses de 3 kg a donc été lessivé.

Fait à noter cependant, les notes de terrain sur l'échantillon montrant une anomalie de 440 ppb suggèrent que ce till qui a été collecté sur du matériel qui semble avoir été peu affecté par le niveau lacustre. Ce till provient d'une crête qui semble s'apparenter à une moraine de De Geer. Ces moraines sont formées à la marge glaciaire lors du retrait de la glace et elles représentent un pincement du till sous-jacent. Ceci suggère donc que les résultats de ce till peuvent être considéré comme fiable.

### Conclusions et recommandations

Si les levés de terrain sont considérés comme fiable, i.e. que toutes les moyens ont été pris lors de l'échantillonnage pour éviter la collecte de matériel remanié par le lac, les résultats suggèrent donc que la région échantillonnée ne montrent aucun indice de la présence de roches possédant une minéralisation importante, du moins dans l'optique d'un gisement pouvant mener à l'exploitation. Ce commentaire s'appuie non seulement de ces résultats, mais aussi sur le fait que les tills de surface de la région du camp minier de Red Lake montrent des teneurs en or qui sont nettement supérieur à celles qui ont été obtenues au cours de la présente campagne de prospection (il faudrait cependant s'assurer que les tills de la région de Red Lake sont effectivement des tills de surface et non des tills provenant de campagne d'échantillonnage par forages, lesquels tills proviendraient de profondeurs n'ayant pas été affectées par le remaniement causé par le lac).

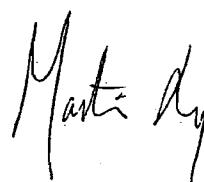

On ne peut cependant ignorer le secteur sud de la région échantillonnée où un till montre une anomalie de 440 ppb. Les données de terrain suggèrent qu'il s'agit d'un échantillon représentant un 'till de base' et que les analyses obtenues peuvent être considérées comme très fiables. De plus, 3 à 5 échantillons de ce secteur montrent des valeurs qui peuvent être considérées comme

anomales pour la région. La distribution de ces échantillons indique également un regroupement de tills anomaux qui suggère une dispersion glaciaire en provenance d'un secteur spécifique de la zone de roches vertes, et ce malgré que la maille d'échantillonnage soit relativement grande. Dans le contexte d'une première phase d'exploration, ces résultats semblent former une première cible qui pourrait faire l'objet d'une nouvelle campagne d'échantillonnage. De nouveaux travaux pourraient permettre de confirmer ou d'infirmer la présence d'une zone intéressante pour des travaux de plus grande ampleur, en plus de préciser la géométrie des tills anomaux de ce secteur. Si cette campagne devait être faite, les recommandations suivantes devraient être considérées (sans ordre précis).

- La nouvelle zone d'échantillonnage devrait porter essentiellement dans le corridor compris entre la partie orientale de la zone de roche verte et 2 à 3 km en aval glaciaire de l'échantillon anomal (440 ppb); cette zone devrait comprendre le secteur des autres échantillons anomaux.
- La maille d'échantillonnage devrait être plus serrée. L'échantillonnage devrait porter essentiellement dans les secteurs où le till est présent sur des hauts topographiques, sur les faces d'arrachage (amont glaciaire) de zone rocheuse (voir schéma de Henderson (1994) et les zones encerclées en jaune sur la carte montrant un collage de photo aérienne fournie ici).
- Il devrait être envisagé d'échantillonner le till le plus profondément possible afin d'éviter la zone de surface où le till est susceptible d'avoir été remanié par les eaux du lac, et de se rapprocher plus près du roc. Dans cette optique, des forages représenteraient l'approche idéale, mais une méthode alternative comme l'utilisation d'un Pionjar pourrait aussi permettre d'échantillonner des tills à de plus grande profondeur. Ceci aurait l'avantage de mettre de côté les 'doutes' concernant la qualité du matériel analysé (vs till de surface remanié).
- Échantillonnage de 4 à 5 échantillons de till à proximité de l'échantillon ayant donné une valeur de 440 ppb.
- Les graviers des échantillons de tills anomaux du secteur sud devraient être broyés et soumis à des analyses pour leur teneur en or afin de voir où se trouve l'or (dans la fraction fine (matrice) ou grossière (clastes)), et ainsi préciser la cause de l'anomalie de l'échantillon de 400 ppb. Même chose pour les échantillons de 10 kg de ce secteur. Bien qu'on ne retrouve pas d'or visible dans ces tills, est-ce que la matrice ou graviers de ces tills contiennent de l'or?
- Une attention particulière devrait être aussi porté sur les blocs erratiques de ce secteur.

## INTRODUCTION

***The property is located at 60 km north of the town of Red Lake, within the Berens Rivers Subprovince, between Red Lake (Uchi Subprovince) and McInnes Lake greenstones belt (Sachigo Subprovince).***

Red Lake North project is an overburden sampling campaign for gold exploration that has been carried out on the Red Lake North project, in the Red Lake area (NTS 52N05, 52N06 and 52N12), northwestern Ontario (**figure 1**). This property covers a thin sliver of greenstone which forms an extension of the McInnes and/or Red Lake greenstone belt. This report describes the results of a regional sampling campaign covering the property. This campaign is the first involvement of IOS Services Géoscientifiques inc. on this project.

This report was written by the author in accordance of specification for assessment filing. It aims to describe the sampling program, its preparation procedures and to present the geochemical results. Only a preliminary interpretation has been requested by client.

## TERMS OF REFERENCE

Agnico-Eagle contracted IOS Services Géoscientifiques inc. to carry out a glacial sediment sampling program over the Red Lake North property. IOS was responsible for the selection of sampling site, collecting 3 kg and 10 kg samples, logistic organisation, samples management and submittal to laboratory, and implementing a quality control program.

Numerous documents were provided by the client, such as mapinfo file, geology and quaternary geology including digital aerial photographs. Agnico-Eagle's geologist, M. Laurent Eustache, provided a first sampling pattern. This planification was modified by IOS Services Géoscientifiques inc. to adjust to the local ice flow direction and glacial sediment type. The final sampling site was approved by Agnico-Eagle's geologist. Patrice Villeneuve, P.Geo, was appointed IOS's project manager while field works were under direction of Jonathan Lalancette, P.Eng. On top of the geochemical analysis, selected samples were processed in IOS facilities for a visual examination and recovery of gold grain. Chemical analyses were carried by ALS Chemex, of Val-D'or.

Subsequent of the presence of high gold content in sample 73820616, a set of 17 samples, selected by the client from the vicinity of sample 73820616, were submitted for

Figure 1: Project location

further assaying of the mud and heavy mineral concentrate plus a visual examination of pebbles.

In accordance to services agreement with Agnico-Eagle, IOS Services Géoscientifiques inc made a first approach with Whitefeather Forest Management Corporation to offer employment to members of Pikangikum First Nation in order to assist the geologist in the field.

## **PROPERTY DESCRIPTION**

The Red Lake North property is located approximately 60 km north of the town Red Lake, northwestern Ontario. The property consists to 124 contiguous registered claims, for 29 315 hectares, and characterised by a lengthy shape between Nungesser Lake and Berens Lake. The property is bounded between 93° 26' to 93° 45' of western longitude and 51° 23' to 51° 45' of northern latitude (*map 1*). Agnico-Eagle Canada Ltd. owns 100% of Red Lake North Property. The property roughly covers remnants of supracrustal rocks within the Berens River Subprovince.

***Access to the property required various means of transportation: truck, boats and helicopter.***

The area is accessible by truck from Red Lake city, via Highway 125 to Nungesser road which is all weather gravel road. A fire Ranger camp located on north-east part of property and outfitter camp situated on west part of Nungesser Lake are the only infrastructure known. The south part of property (at south of Nungesser Lake) is easily accessed from Red Lake via Nungesser road to Sidace and Coli roads. From the Nungesser road, some rivers and lakes are navigable over short distance. Access for north-east and central areas requires used of helicopter to be effective.

The property is characterised by gently rolling landscape with hills culminating up to 450 m. Swamps, bogs and lakes occupy depressed area, representing the plains of the former Agassiz lake beds. Drainage pattern is poorly developed with meandering streams. Forest cover is moderate to dense and typical of boreal forest: white and black spruce, balsam fir, jack pine, white birch, trembling aspen. The extensive Nungesser Lake occupies large part of the south of property. Outcrops are sparse and mainly distributed on north and center part of the property.

The property is located within the Whitefeather forest area. Currently, there are no restriction on land use else than current environmental regulations. Dialog between

Ontario Ministry of Natural Resources and the Pikangikum First nation are in progress regarding forest management strategy and to delineate protected area within Whitefeather forest area.

No permit are required to perform field work, including drilling on the land portion of the property. A permit from Federal Department of Fisheries and Ocean is required if lakes, shore and rivers are affected by activities. It is a recommended practice to inform First Nation prior to initiation of mining exploration works, which was Client's responsibility.

## PREVIOUS WORK

The first reconnaissance mapping into Red Lake North property area was published by J.A Donaldson (1969) from the Geological Survey of Canada at a scale of 1:253 440. Subsequently, regional map by Ayres et al. provided an overview that outlined greenstone rock from granitoid rock. From 1988 to 1993, D. Stone (Ontario Geological Survey, an Open file Report) made geological mapping of Berens River Subprovince and published a set of map at 1:50 000 scale, provided an outline of the Berens River Subprovince. More recently, Buse and Préfontaine (2007) mapped the Berens rivers area with emphasis on greenstone remnants at a scale of 1:20 000.

A quaternary geology map (1:506 880) covering the property was made by V.K. Prest (1963) from the Geological Survey of Canada. Later, P.J. Barnet and al. from Ontario Geological Survey, published a map of the west central-sheet, at a scale of 1:100 000.

Federal low-density (800 m spacing) airborne magnetic surveys were published in 1963 by Geological Survey of Canada. Recently, a Geotem1000 System high density (200 m spacing) airborne magnetic and deep penetrating electromagnetic survey covering part of the Whitefeather forest area was carried out for the Ontario Geological Survey (2008) at 1:50 000 scale.

Only little exploration field works has been carried out within Red Lake North property according to the Ontario government's assessment files. From 1977 to 1980, Dome Exploration Ltd. performed a regional airborne magnetic and electromagnetic survey (1977) followed of a ground magnetic and electromagnetic survey (1978) and a diamond drilling program (1979). Rempart Venture LTD in 2004 conducted a glacial till sampling program by the use of hydraulic hydraulic shovel southwest of Nungesser Lake.

## GEOLOGY

The Red Lake North property is located in northwestern Ontario within Berens River Subprovince, sandwiched between Sachigo Subprovince to the north and the Uchi Subprovince to the south. Berens River Subprovince is dominated by Neoarchean felsic and intermediate plutons with greenstone slivers 2 to 3 km wide (**figure 2**) which are trending northerly. These are remnant forming an extension of the McInnes (Sachigo Subprovince) and Red Lake greenstone belt (Uchi Subprovince) according to Buse and Préfontaine (2007).

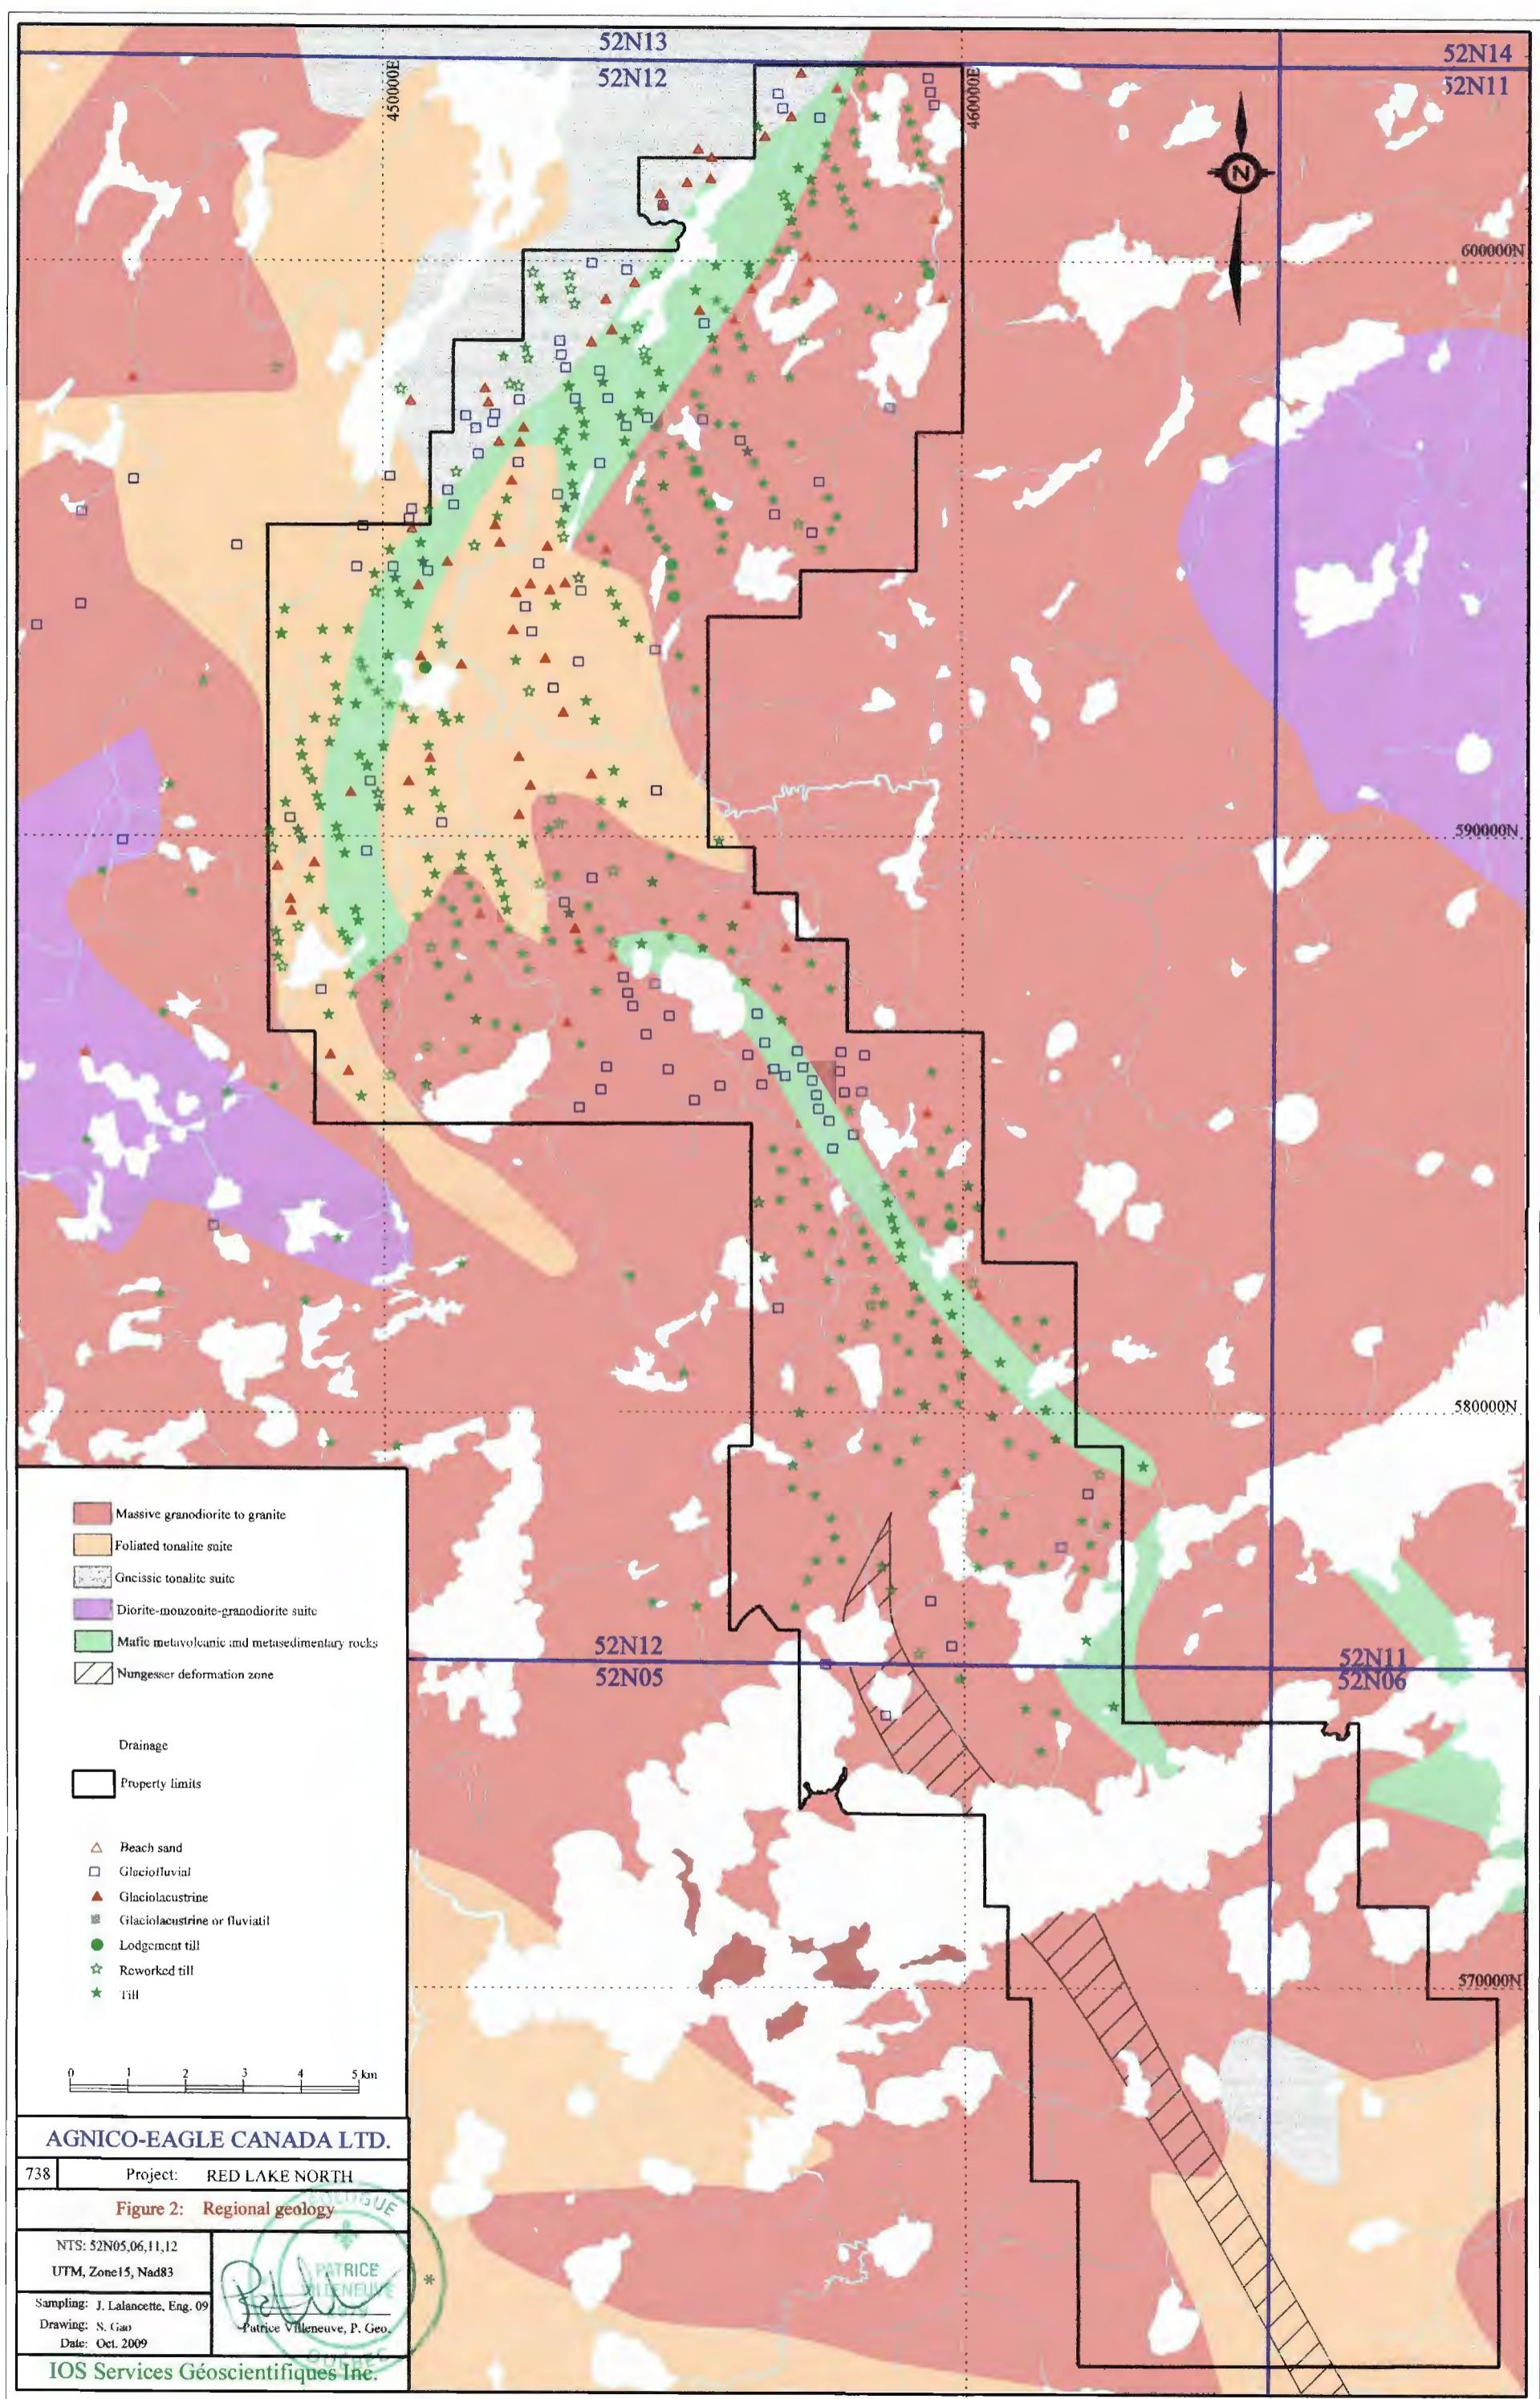

The greenstones consist of mafic volcanic rock, mostly amphibolites, plus dacitic tuff, wacke and rare rhyolite. Metamorphism grade ranges from upper greenschist to upper amphibolite facies, increasing southward (Buse and Préfontaine 2007).

Plutonic rock are strongly foliate and locally mylonitized and fractured within a 1 km-wide zone that strikes approximately 330 degrees through the Nungesser lake area (Stone and Good 1990). This mylonitized zone is located south-west of property.

## QUATERNARY GEOLOGY

***The property is covered mostly by a blanket of unconsolidated glacial diamicton (till), plus glaciofluvial and glaciolacustrine sediments which were mainly deposited during late Wisconsinian ice melt-down of Laurentide Ice sheet.***

Regional quaternary geology map is available for the area (V.K, Prest 1963 and P.J, Barnet and al, 1991) (**figure 3**). The most prominent landform in the area, located 15 km to SW of property, is the Trout Lake ridge which is a part of Lac Seul terminal moraine. This northwest trending Ridge seems to be encroached beneath the clay deposit. It rises above the clay as a set of knobs and ridges that extend northeastward (Prest 1981). This NE trending landform appears to be an interlobate moraine following the NW boundary of property. The south part of the property hosted numerous narrow and low profile transverse ridge corresponding to De Geer moraines. Streamlined landforms (drumlin, crag and tail) are uncommon in the Red Lake area and essentially observed outside of property limit. The last ice-flow direction appears to be WSW, based upon these landforms, as observed on air photos as well as based upon linear drift features based upon quaternary geology map from Prest 1963.

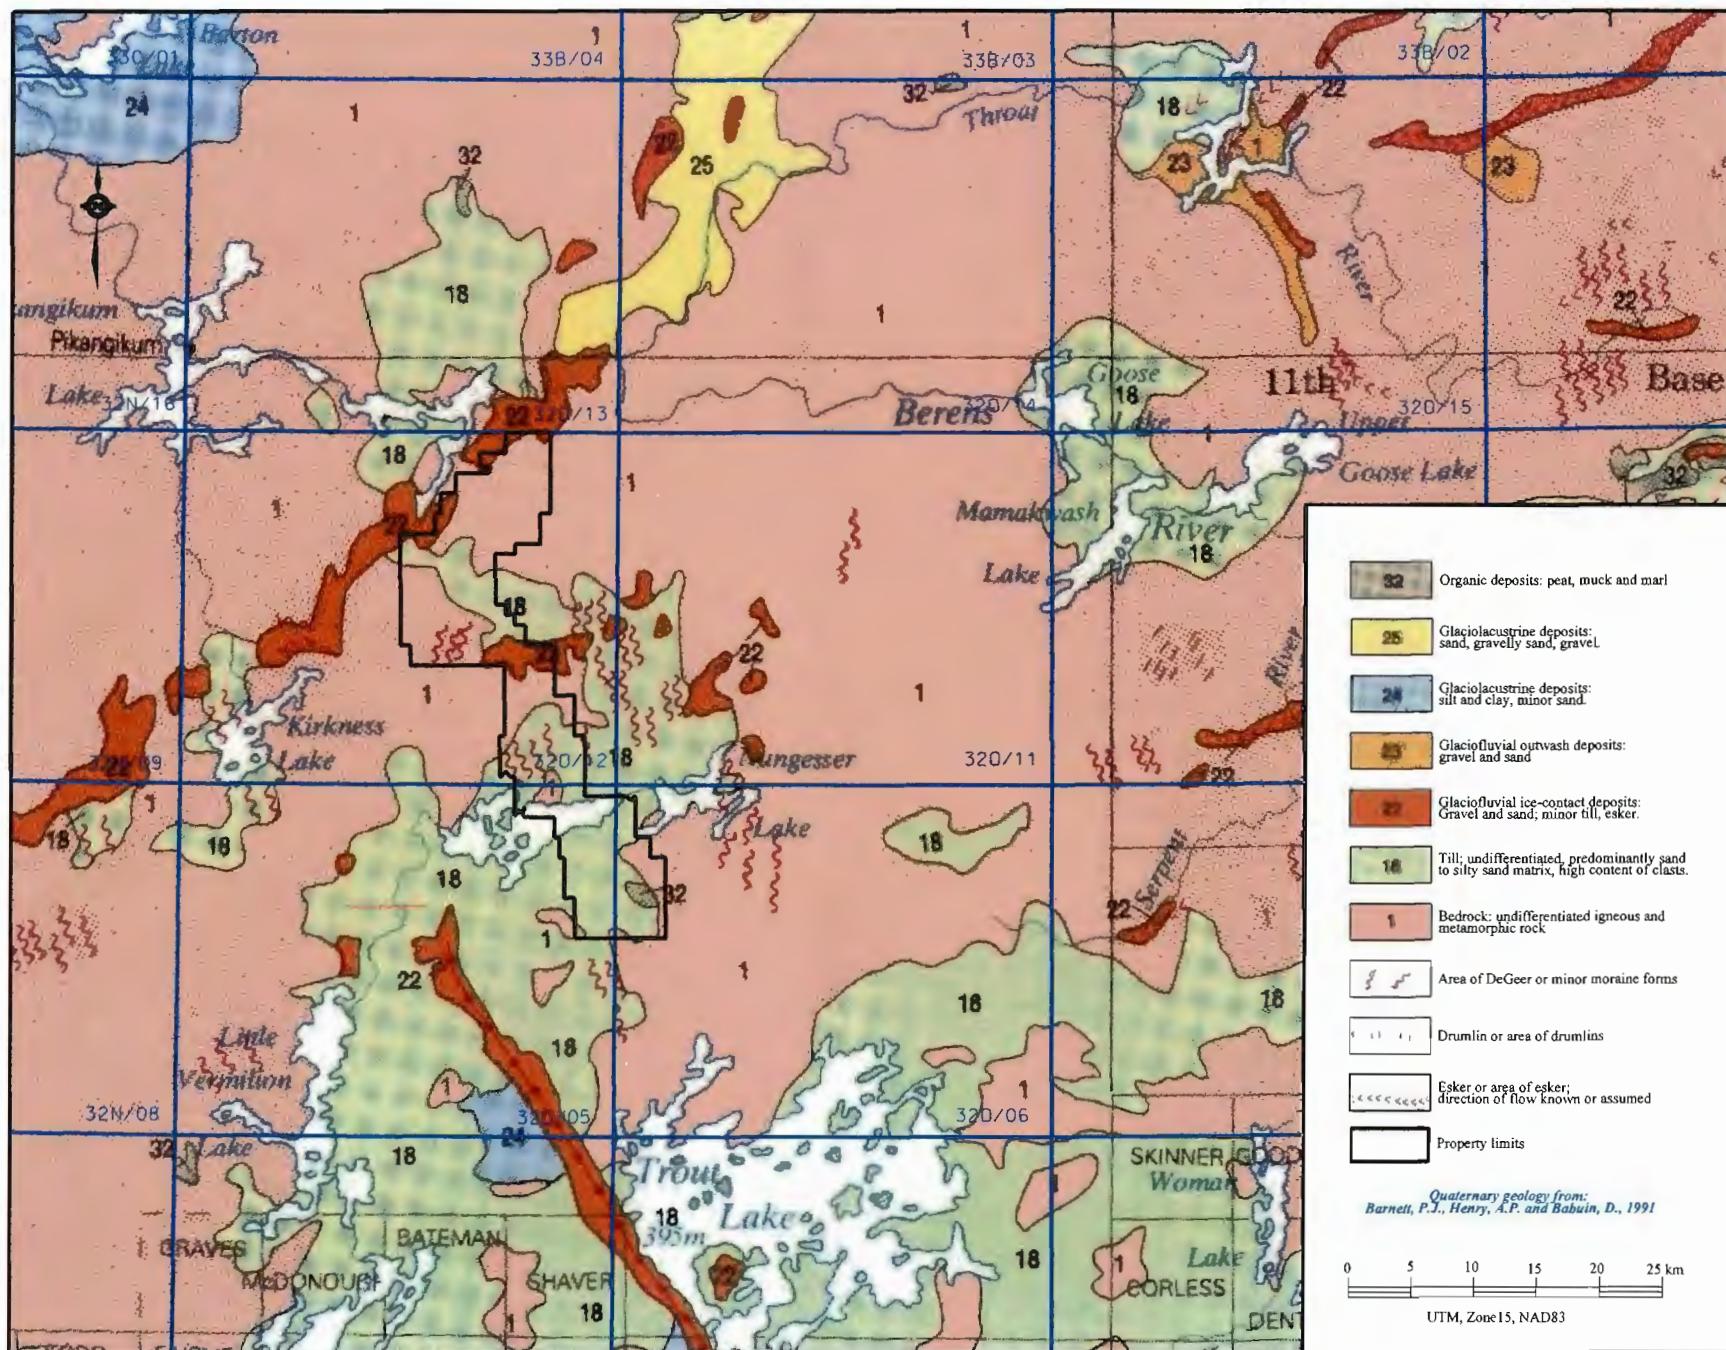

Figure 3: Quaternary geology of project region

## GLACIAL SEDIMENT

Most collected material described as sandy to silty sand diamicton with pebble or boulder clasts, generally loose to weakly compact, was interpreted as till. This glacial sediment forms a discontinuous thin blanket wrapping bedrock dominated terrain. It is capped by bouldery debris. Thicker accumulation of till was observed down-ice of prominent outcrops or highland area. Near bedrock, these deposits are typically reworked and consisted of sandy to bouldery diamicton, poorly to well sorted. It was labelled as reworked till. Finally, silty sand diamicton, weakly to strongly compacted, containing some striated clasts and generally sampled near bedrock depression have been interpreted as lodgement till.

## GLACIOFLUVIAL AND GLACIOLACUSTRISE SEDIMENTS

Glaciofluvial material is associated with interlobate moraine and consists of gravelly to pebbly sand with minor gravel, generally sorted. Some stratified sediments were observed bordering Nungesser roads on the northwestern part of property. No obvious landform is associated with these glaciofluvial deposits, such as kame, esker, outwash etc. The glaciofluvial deposits are present either in topographic high and low terrain.

Glaciolacustrine silt and clay sediment covers generally lowland and depressed area, particularly near meandering streams. In the course of sampling, no evidence of clay/silt rhythmic varves was observed. Well sorted fine sand to silty sand with minor gravel deposit which is overlying the clay plains, the glaciofluvial deposits or the till may result from reworking by Lake Agassiz.

## 2009 SAMPLING CAMPAIGN

A total of 636 samples were collected during summer 2009 sampling campaign on Red Lake North project: 453 glacial sediments, 108 fluvioglacial or morainic sediments, 71 glaciolacustrine sediments, 3 alluviums and one sample of beach sand. A total of 581 samples, 2.5 kg each, were collected for geochemical analysis (cyanide leach method) plus 55 samples, 10 kg in size, were collected for visual examination and extraction of gold grain. The campaign started on June 18<sup>th</sup> and was completed on July 11<sup>th</sup> (see daily reports in **appendix 1**).

The sampling program was executed by IOS staff: Jonathan Lalancette, P. eng ; Steeve Lavoie, geologist in training; Réjean Godin, geologist in training; Paméla Tremblay,

engineer in training; Jonathan Servais, geologist in training, Pierre-Luc Gaudreault, biologist, Éric Larouche, geology student and David Boulanger, labour. The crew lodged at hotel in Red lake municipality. An Astar-BA Helicopter, chartered from Heli-Explore Inc., was used to access the property, based at Red lake airport. Samples were collected either by helicopter heap-frog or truck along Nungesser gravel road.

IOS crew was in charge of carrying the samples from Red Lake to ALS-Chemex facility in Val-d'Or and to IOS facility in Ville de Saguenay.

## SAMPLING PROCEDURES

The Red Lake North sampling campaign is a regional survey. The complete property has to be covered with a series of sampling fences perpendicular to glacial ice-flow and greenstone belts location. Samples were spaced 250 m apart along the fences, with 500 m between fences in the vicinity of the greenstone belt. Rest of the grid had a spacing of 500 m along fence and 1 km between. These fences are oriented west southwest, perpendicular to local ice-flow direction. Final sample site selection is decided by sampler, according to local ground morphologies. In numerous instances, many test holes were needed prior to finding suitable material. **Map 2** provided final samples disposition.

Sampling was carried along foot traverse by two men crews. At least one sampler was experienced with quaternary geology, being accustomed with material and environment descriptions. Sample site descriptions are provided in **appendix 2**. Registered relevant information were soil structure, cobbles composition, topography, vegetation, drainage, glacial or glaciofluvial landforms, description of surficial boulders and outcrops lithologies.

The 2.5 kilograms samples dedicated for geochemical analysis were collected at every site. The 10 kilograms samples dedicated to mineralogical samples were collected every 10 sites, on the same hole as the geochemical samples.

### GLACIAL, GLACIOFLUVIAL AND GLACIOLACUSTRIAL SAMPLING

Sampling holes, 0.5-1 m deep, were dug with the use of a hand shovel and crowbar. Samples are ideally collected within C horizon, below any podzolization evidences, or within B<sub>2</sub> horizon if C is not accessible (**figure 4**).

Ideal sampled material is basal or melt-out till. However, quaternary geology of Red Lake area is complex due to Agassiz Lake influence. Glacial sediments were not available everywhere, being overlain by glaciofluvial and glaciolacustrine sediment. Favourable till is typically found on the down-ice side of outcrop margin or in depression n the bedrock surface. However, near outcrop surface, the material is often reworked by lacustrine processes.

**Figure 4:** Soil profile.

Sampling holes were dug with hand shovels, which were cleaned before each uses in order to avoid contamination. Samples were bagged in 5 litres nylon bags, protected by a rice-bag and sealed in the field. Sample bags were prepared in advance. Sample numbers are written twice upon bags, plus on two flag-tape pieces leaved sampling site and tied around nylon bag. Two waterproof tags with bar code number were dropped in the sample bag and between the plastic and nylon bag.

## MINERALOGICAL SAMPLE PROCESSING

Processing of samples dedicated to mineralogical studies followed standard procedure implemented in IOS Services Géoscientifiques inc. Laboratory (**figure 5**), along with tight quality control. The purpose of sample processing has been to concentrate heavy minerals in <250 microns, in order to extract gold grain. Sample processing and results are presented in **appendices 3, 4, 6 and 7**. Quality control procedure and results are provided in **appendix 3, table 3**. No significant problems were detected.

## GEOCHEMICAL ANALYSIS

### MUD ANALYSIS

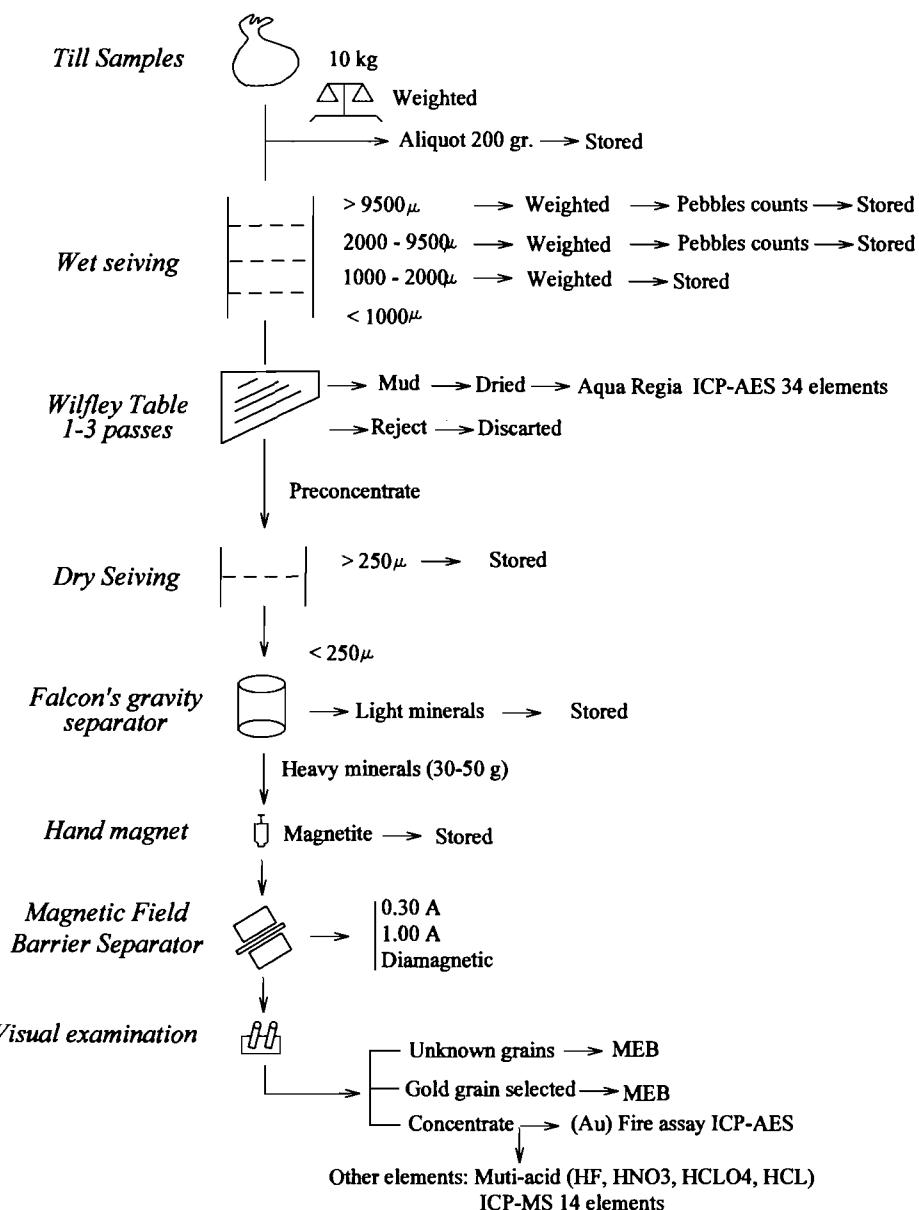

Muds recovered from the Wilfley table from a subset of 12 samples were submitted for geochemical analysis. This mud represents the slimes, typically <63 µ, which is washed and recovered from the Wilfley table, dried and stored. They were submitted to ALS-Chemex for an ICP-OES analysis, after Aqua Regia digestion (ME-ICP41). This analysis has been used routinely in our heavy mineral concentration process and large database is available to the author for comparison. The method has been proven as efficient to detect glacial dispersion for elements not partitioned into silicates, such as metalloid (As, Sb, etc.). Gold was been assayed by fire-assay with ICP-MS finishing (Au-ICP-21). Results are listed in **appendix 5**.

### HEAVY MINERAL CONCENTRATE ANALYSIS

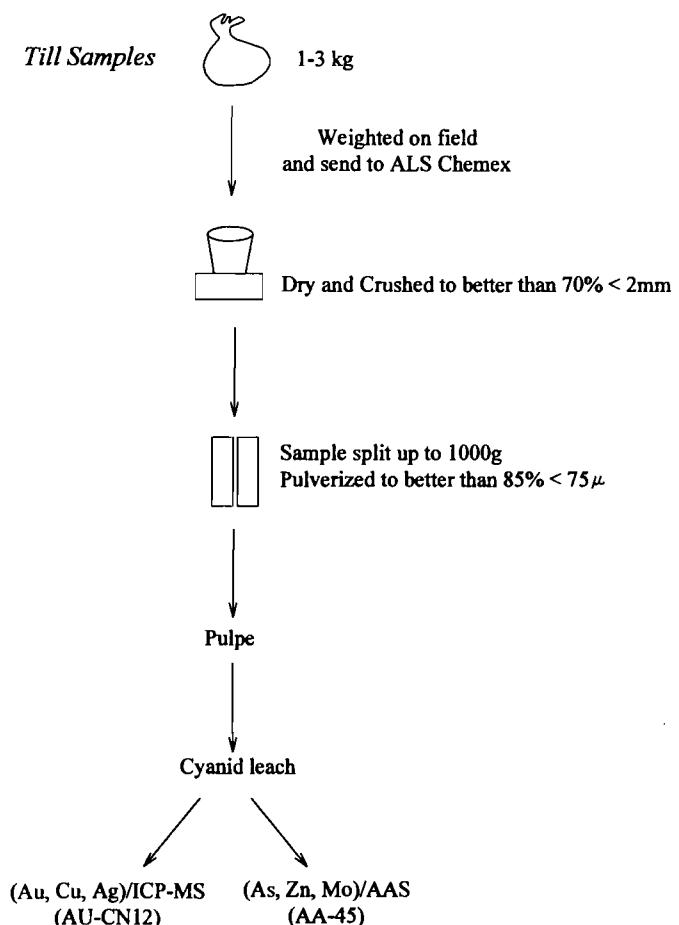

A set of 17 fine heavy concentrates, used for gold visual identification, were submitted for assays. For such, the various magnetic fractions produced for the visual exam were concatenated. However, gold grains, extracted in the course or visual examination, were not returned into the concentrate. Reconstituted samples were sent to ALS-Chemex, pulverized with an agate mortar, and submitted for ICP-MS analysis after multiacids digestion (ME-MS61), plus a fire-assay with ICP-MS finishing for gold analysis (Au-ICP21). This protocol is implemented in our heavy mineral process for gold, and thousand of analyses are available to the author for comparison. Results are listed in **appendix 10**. Interpretation of these analyses is complex, most metals being partitioned into various minerals with different concentration factor. Base metals are typically partitioned into ferromagnesian silicates, the effect of which needs to be compensated to estimate the contribution of meaningful sulphides.

# Figure 5: Sample treatment scheme

## Heavy mineral process

## Sample process

## CYANIDE LEACH ON BULK SAMPLES

Samples collected for geochemical analysis only (2.5 kg) were delivered to ALS Chemex facilities, in Val-d'Or by the crew on their way home. These samples were analyzed using a bulk cyanide leach method, which allows for the determination of cyanide extractable gold in large ( $\leq 3$  kg) soil and sediment samples. The use of large sample weights allows for good sampling statistics and counteracting the nugget effects. The leached liquors were analyzed with ICP-MS methods, enabling low sub-ppb detection limits for gold and silver, as well as ppm levels for arsenic, copper, zinc and molybdenum.

The sample is weighed, dried and crushed, without removing the pebbles, to 70% less than 2 mm (Tyler 9 mesh, US Std. No.10 screen). A split of up to 1000 g is then pulverized 85% less than 75 micron mixed with a dilute alkaline sodium cyanide (0.5%) solution (in the presence of lime), and rolled for a minimum of 12 h. Gold is extracted from the liquor with DIBK and can checked by AAS. Gold, copper, silver were determined by ICP-MS, while arsenic, zinc and molybdenum were analysed atomic absorption spectrometry (AAS). Results and quality control procedures are reported in **appendix 11**.

## INTERPRETATION OF RESULTS

### MUD AND HEAVY MINERAL ANALYSIS

A set of 17 samples were selected by the client for supplementary analysis. These samples are located in the vicinity of 73820616, which returned highly anomalous gold value by bulk cyanide leach. Although this value is considered as an erratic, the purpose of these analyses was to investigate if this value was supported by neighbouring samples.

Mud was available only for 12 samples, not including 73820616. Only traces of gold were detected, with a maximum of 5 ppb, and correlated to traces of silver. No anomalous metalloids, such as arsenic, antimony, sulphur or bismuth, is detected, nor is tungsten, molybdenum and other oxycations. No significant base metal is detected.

**Some samples show traces of gold and silver, but not enough to constitute anomalies.**

Heavy minerals analyses were obtained on 17 samples. Some samples show traces of gold and silver, but not enough to constitute anomalies. The sample containing the highest value of gold, 0.074 ppm, is in the 88<sup>th</sup> percentile compared to historical values compiled by IOS. No significant metalloid (As, Sb, Te, Bi, Se) were detected, while oxycations are not anomalous. Base metal content is typical of ferromagnesian minerals.

## BULK SAMPLES

Bulk cyanide leaching protocol enable to dissolve the free gold as well as the sulphide hosted gold out of a large sample. Such method allows to counteract the usual nuggets distribution of gold encountered in most detrital materials. A better representativity can thus be achieved compared to other fire-assay or Aqua Regia digestion methods. Also, it shall be considered that any gold chemically partitioned into non-sulphide minerals will not necessarily be measured. Finally, this method enables exceptionally low detection limit of 0.1 ppb, which is needed when trying to detect distal signatures.

**One sample has reported an outstanding gold value at 440 ppb, associated with an outstanding copper value above range and anomalous silver.**

One sample, 73820616, has reported an outstanding gold value at 440 ppb, associated with an outstanding copper value above range (>100 ppm) and anomalous silver. Such anomaly may have been caused by a single mineralized pebble crushed with the sample and is not likely representative of its surrounding.

Gold titrates between the detection limits and 8 ppb (**figure 6**). Such signature is expected in the absence of nuggets or gold flakes in the samples, and can be considered as anomalous. On the centile-grade distribution diagram, we can notice the background population up to 2.0 ppb with a median at 0.7 ppb. This population has a log-normal distribution, and count for more than 90% of the samples.

This population is considered as the mere regional background, and no more attention shall be devoted to samples below 2.0 ppb. It is unclear to the author<sup>1</sup> how this

---

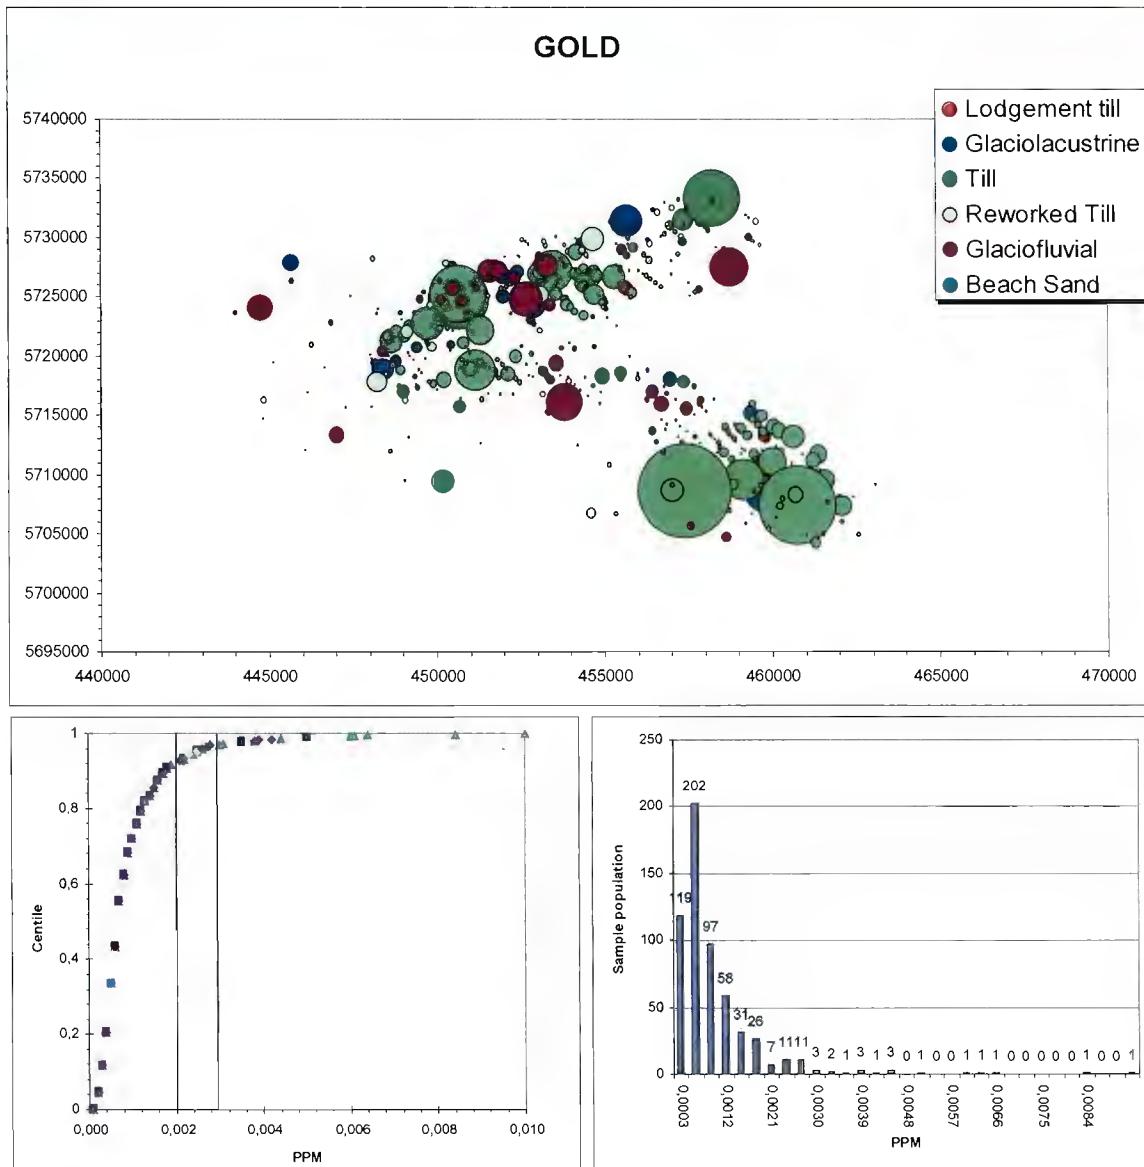

<sup>1</sup> The current survey is the first one carried by the author on which the cyanide leach method is used. He thus can not make comparison with other area.

population compare to other area, and if this population is indicative of a regional gold endowment or not. The reliability of the method is indicated by the near absence (1 sample) of samples below detection limit.

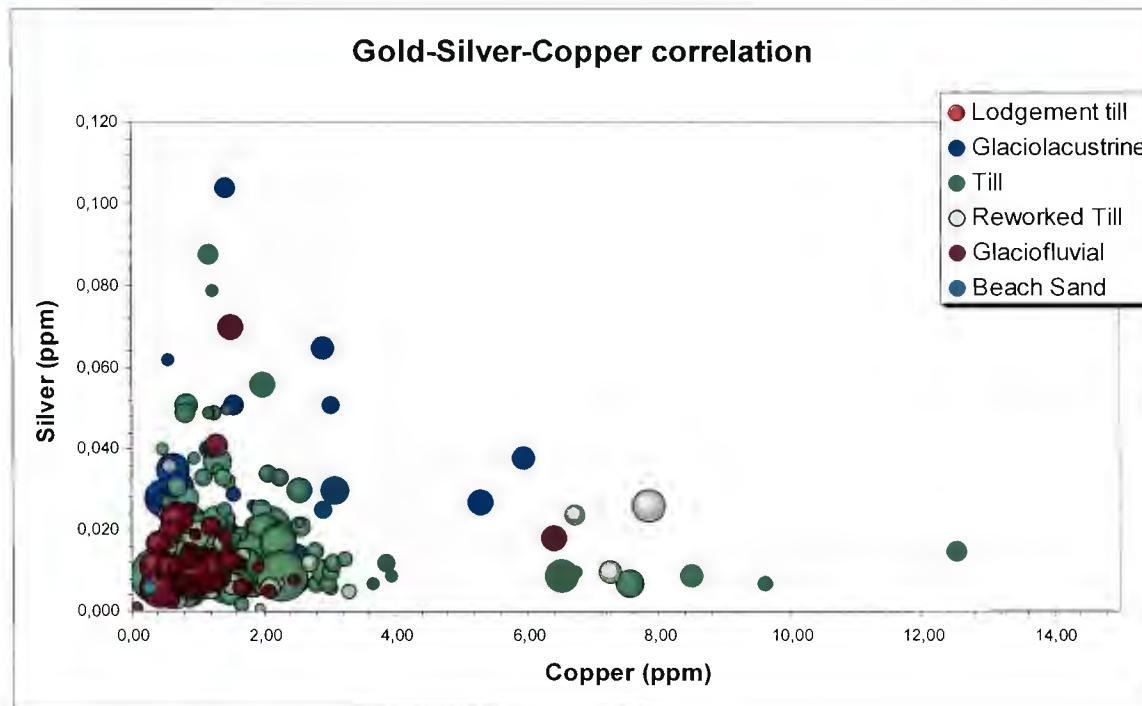

A second population of 30 samples is defined between 2.0 and 3.1 ppb. This population is discernable by a break along the centile-grade curve, as well as a distinctive hump on the histogram. The samples forming this population shall be considered as anomalous and significant. These samples are dominantly from melt-out tills. They typically form clusters, suggestive of local gold enrichment.

A series of 16 samples shows erratic values between 3.1 ppb and 8.4 ppb. Being erratic, these samples must be considered as anomalous and have to be individually evaluated. Many of these samples are grouped with the 2.0-3.1 population, and thus considered as part of the same anomaly. Other samples are isolated erratics, and can be considered as caused by the presence of an orphan gold nugget or flake.

Except for the exotic sample 73820616, no relation is present between gold, silver and copper content (**figure 7**).

**Figure 6:** Gold composite diagram. The top bubble-plot represents a sketch-map of the gold grades, the bubble diameter being related to grade. Abnormal sample 73820616 has been truncated at 100 ppb (largest bubble). Lower left diagram is a centile-grade distribution curve. Two distinct populations are visible as changes in slope, from 0 to 2.0 ppb and 2.0 to 3.1 ppb. Erratic samples are scattered above the 3.1 ppb values. Lower right diagram is the distribution histogram, where the second population shows as a distinct hump.

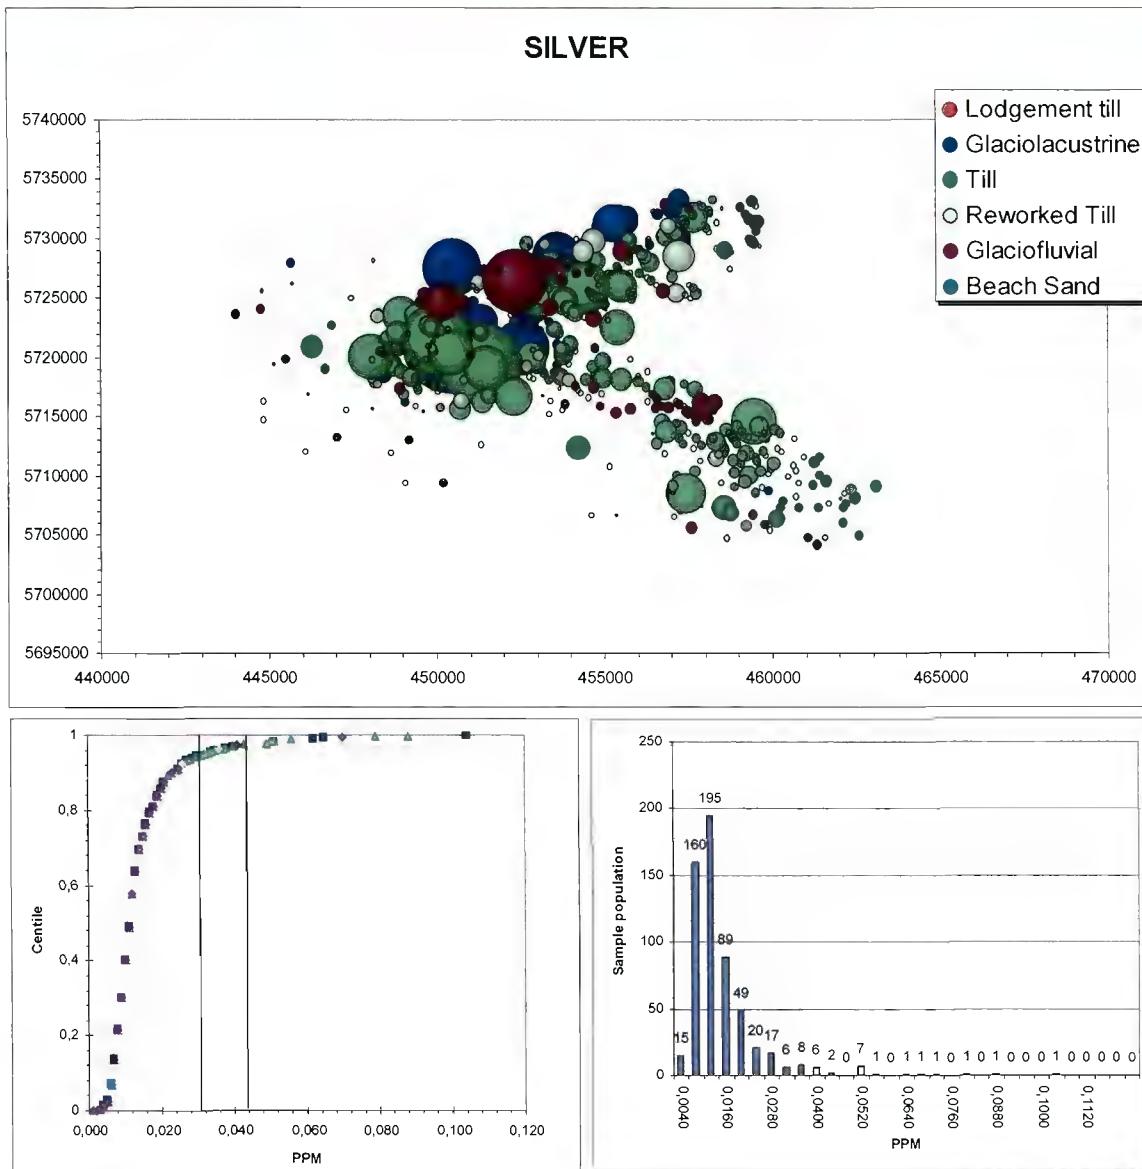

**Figure 7:** Bubble plot representing the abundance of gold in regard of silver and copper grades. No clear relation is outlined. The copper axis has been truncated at 16 ppm, with three samples above this threshold (52.5 ppm, 82.3 ppm, >100 ppm). Silver axis is truncated, excluding the anomalous values.

Silver is ten times more abundant than gold and shows the presence of two populations (**figure 8**). The dominant population has a log-normal distribution between 0 and 32 ppb. No sample is below the 0.1 ppb detection limit, suggesting the reliability of analysis and the absence of low-value skewness. This population account for 95% of the samples, with a median at 11 ppb. Just as for gold, this population is considered as the background and does not deserve more attention.

A second silver population is visible on the centile-grade curve, between 32 and 41 ppb, for 15 samples. This population is considered as enriched, but unlikely to have a common origin. Samples are of diverse materials and grouped as multiple clusters.

Another set of 15 samples represent erratic values above the 41 ppb threshold. These anomalous samples are either associated with clusters of the aforementioned enriched population, or are isolated erratics. These erratics are likely caused by abundant sulphides (such as Ag-bearing pyrite) but are unlikely caused by silver nuggets. They are of diverse origins, including meaningful lodgement till.

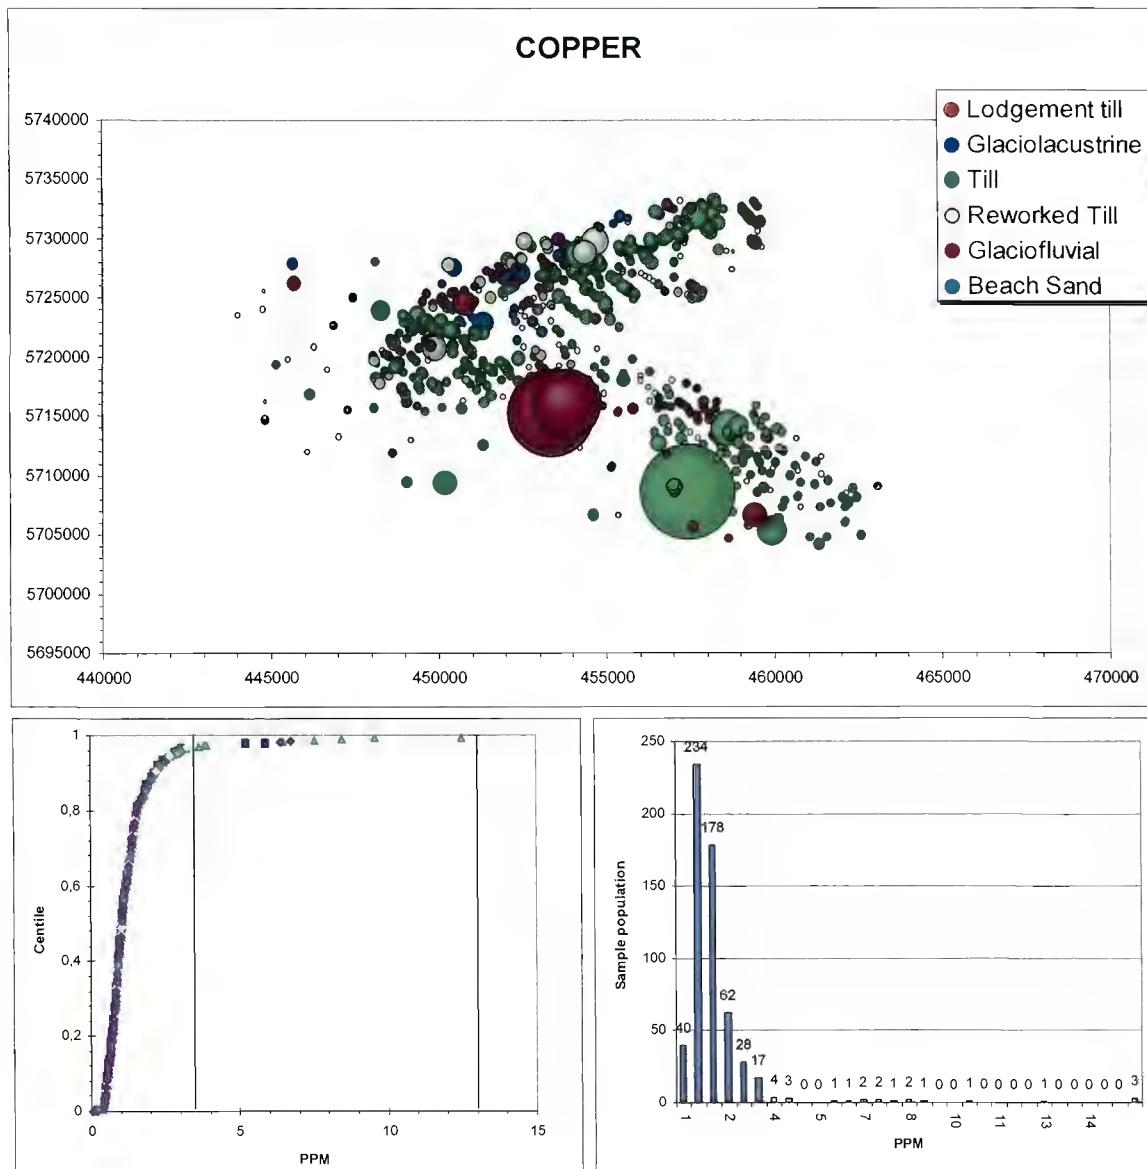

**Figure 8:** Silver composite diagram. The top bubble-plot represents a sketch-map of the silver grades, the bubble diameter being related to grade. Abnormal sample 73820616 is not significantly enriched in silver, and the population has not been truncated. Lower left diagram is a centile-grade distribution curve. Two distinct populations are visible as abrupt change in slope, from 0 to 32 ppb and 32 to 41 ppb. Erratic samples are scattered above the 41 ppb values. Lower right diagram is the distribution histogram, where the second population shows as a distinct hump.

**Seventeen samples are above 3.28 ppm and considered as outliers and anomalous. Three of these are above 50 ppm of which one is 73820616.**

Copper has a single log-normal population ranging between 0.05 and 3.28 ppm (**figure 9**), for 97% of the samples, and a median at about 1 ppm. Careful examination of the centile-grade curve may reveal the presence of multiple interfering populations, expressed as slight changes in the slope. Seventeen samples are above 3.28 ppm and considered as outliers and anomalous. Three of these are above 50 ppm of which one is 73820616. The two others are adjacent to each other (73820571 and 573) and are poorly described sandy material. Abundance of copper is unusual in sandy material, such material being permeable to phreatic water which typically oxidize copper sulphide and leach the copper out. They shall be considered as meaningful anomalies. No gold or silver is associated, but abundance of copper sulphide shall be considered as favourable metallogenic indicator.

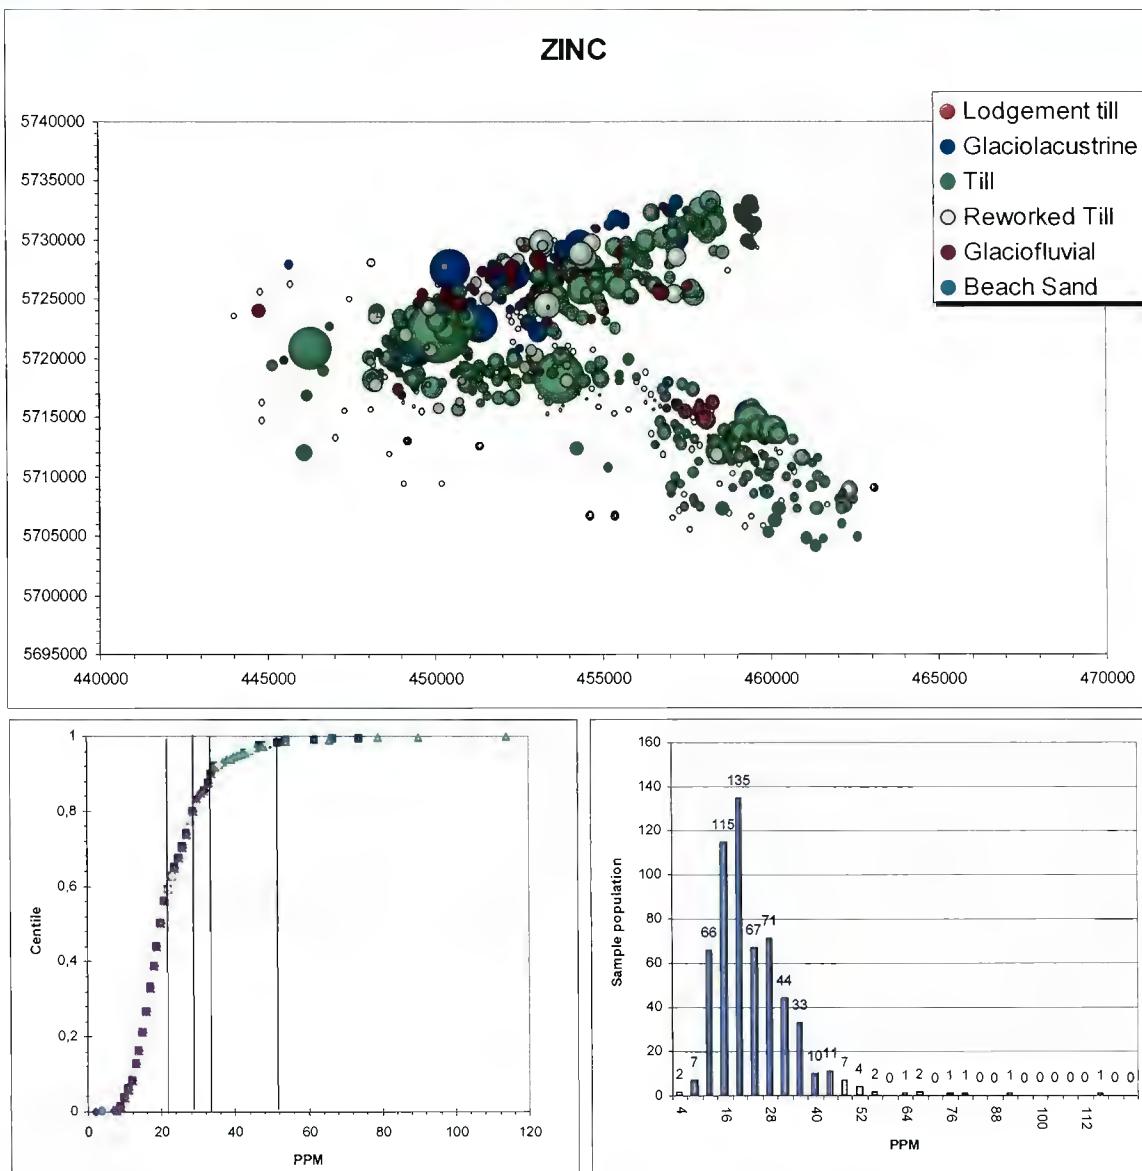

Remaining copper anomalous samples are scattered throughout the survey. It shall be emphasis that the copper measured by the cyanide leach represent only the native and easily leached copper sulphides. Copper hosted in silicate is not measured, which is likely 1-2 order of magnitude more abundant. Therefore, the method is considered as efficient in discriminating sulphidic and non-sulphidic copper.

**Figure 9:** Copper composite diagram. The top bubble-plot represents a sketch-map of the copper grades, the bubble surface being related to grade. Abnormal sample 73820616, indicated as above maximum titration, has been indicated as 100 ppm. Lower left diagram is a centile-grade distribution curve, and grade has been truncated at 20 ppm to ease visualisation of the multiple populations. A single log-normal population is visible up to 4 ppm, measurement above being considered as erratics. Lower right diagram is the distribution histogram, where erratics are visible.

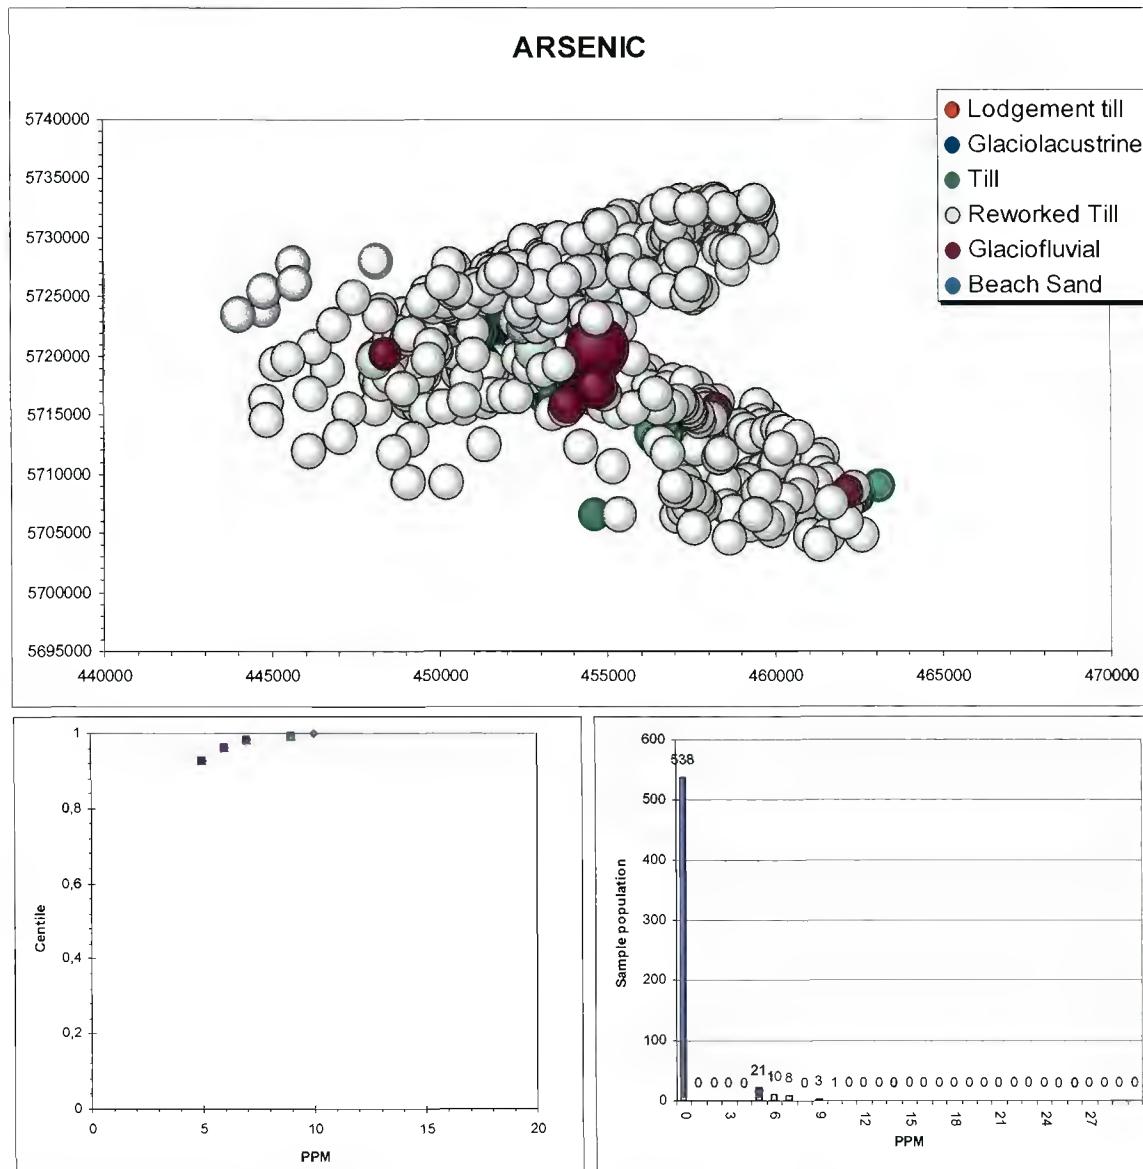

**Anomalous  
values are  
considered  
above 52 ppm, up  
to a maximum of  
114 ppm.**

Zinc shows complex multiple populations, which are partly related to the material type (**figure 10**). The more sandy-gravelly material is typically grading below 35 ppm compared to melt-out and glaciolacustrine material. This suggests oxidation of sphalerite and leaching of zinc by phreatic waters. Anomalous values are considered above 52 ppm, up to a maximum of 114 ppm. Such grade is significantly lower than the zinc typically contain in rock and hosted in silicates. Anomalous samples does not define obvious cluster on the map, and their significance is apparently limited.

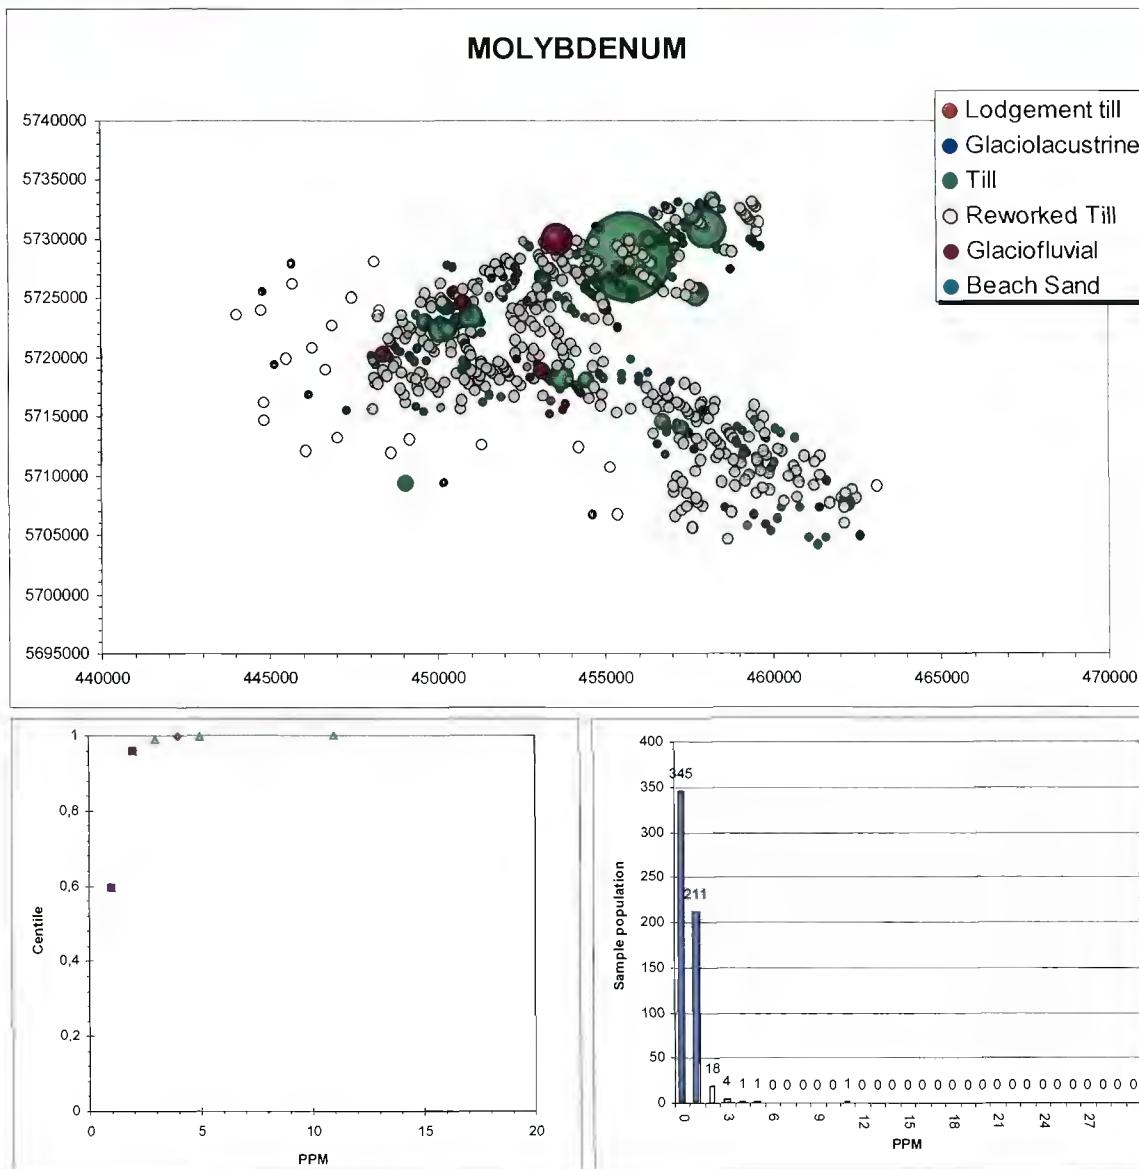

**Figure 10:** Zinc composite diagram. The top bubble-plot represents a sketch-map of the zinc grades, on which the difference between the various sample types is obvious. The centile-grade distribution curve is suggestive of multiple intricate populations, as well as the bumpy histogram. No significantly abnormal sample is present.

Arsenic and molybdenum analyses are too close to detection limits to be of any meaning, and shall be disregarded (**figures 10 and 12**). It is unknown if cyanide leach is capable to extract arsenic from arsenopyrite and lollingite or if it dissolves only scorodite. Similarly, it is unknown to the author if cyanide leach is capable to extract molybdenum from molybdenite, or if it is restricted to jordisite.

**Figure 11:** Arsenic composite diagram. The proximity of detection limit hampers the meaningfulness of this element. Only a small cluster is detected on the center of the property, the meaning of which is uncertain.

**Figure 12:** Molybdenum composite diagram. With the exception of sample 73820064 at 11 ppm, measured molybdenum grades are too close to detection limit to enable reliable interpretation.

## CONCLUSIONS AND RECOMMENDATIONS

Gold has been detected in the glacial sediments on Red Lake North property, indicative of a certain endowment. Interpretation of results is hampered by the local complexity of the glacial geology, which can not be treated as a simple till blanket. Presence of recession moraines and abundant periglacial reworking render the signal noisy and dilute. A few samples shows significant gold content, but effect of mineralized pebble or a nugget can not be ruled out.

In the event Agnico-Eagle intent to resume the project, it is recommended that sampling shall target the underlying remnants of lodgement till, in order to provide results enabling robust interpretation. Access to this lodgement till can be difficult, especially where roads are not available to bring overburden drill or excavators. Uses of a heliportable reverse circulation drill, sonic drill or pionjar driven drill shall be considered.

Mr. Patrice Villeneuve, geo  
1238 Rue de la Pulpe  
Chicoutimi, Quebec  
G7J 4X8

Dear Mr. Villeneuve:

**Re: Incidental Practice Application - OGQ Member No. 976**

I am pleased to advise you that your application for Special Exemption for Incidental Practice in Ontario under the terms of the OGQ-APGO Bilateral Agreement for Professional Mobility in Québec and Ontario has been approved.

Therefore, under the provisions of section 28.(1) 7 of the Ontario *Professional Geoscientists Act, 2000* and using the procedures set out in APGO's By-law No.11 - Mobility Agreement with L'Ordre des géologues du Québec, you are hereby granted a Special Exemption and are entitled to undertake *Incidental Practice* of professional geoscientist work in Ontario.

The terms and conditions of the foregoing are as follows:

**Time Period:** From: June 10, 2009 (retroactive)  
To: August 31, 2009

**For (Name of Client in Ontario):** AGNICO - Eagle Mines Ltd.

**Description of Work and Location:** Glacial sediment sampling, Red Lake Area.

As you are aware, *Incidental Practice* is defined as practice in a specific location which is limited in time and scope to a maximum of three separate incidents within a maximum duration of three months combined, and occurring in any 12-month period.

You are reminded that all persons practising professional geoscience in Ontario are required to operate under the provisions of the APGO Act, the supporting regulations and by-laws made under this Act (please visit APGO's web site at [www.apgo.net](http://www.apgo.net)), and all other applicable legislation governing the work. It is understood that it is the practitioner's responsibility to ensure that s/he is fully apprised of all requirements pertaining to the conduct of the work to be undertaken under this special exemption.

Sincerely,

Andrea Y. Waldie, P.Geo.  
Executive Director & Registrar

COMMENTAIRES SUR LES TRAVAUX : Départ vers 7 h 30 du campement. Pierre-Luc et Réjean sont allés chercher les Amérindiens au lac Nungesser et ont fait une traverse en bordure de la route. Jonathan et Steeve sont partis en hélicoptère. Jonathan S. est resté au chalet en raison de sa blessure à l'oeil. L'équipe de Réjean est revenue vers 18 h 30 au chalet et l'équipe de Jonathan vers 16 h 30.

COMMENTAIRES SUR LA GÉOLOGIE : L'équipe de Réjean a fait une traverse en bordure de route, une partie avec les Amérindiens . 8 échantillons ont été pris. L'équipe de Jonathan a fait une traverse dans le secteur central de la propriété. 12 échantillons ont été pris pour un total de 20.

Project	#Sample	Comments
09-738	73820001	Glaciofluvial material with few pebbles. Very sand rich.
09-738	73820002	Till with pebbles, gravel, sand and silt. Oxidized.
09-738	73820003	Melt-out till with a lot of boulder and pebbles. Very hard to sample.
09-738	73820004	Till with boulders, pebbles, gravel, sand and silt. Hard to take a sample.
09-738	73820005	Glaciofluvial (glaciolacustrine?) fine grained sand and silt. The sample has been taken in B layer because it contains much coarser grains than the C layer.
09-738	73820006	Melt-out till sampled in a trap at the back of an outcrop. Sampled on the top of a rocky outcrop hill.
09-738	73820007	Same hole than #73820006
09-738	73820008	Glaciofluvial sample, few gravel, mainly medium to coarse grained sand. Layer of clay at about 20cm of this sample.
09-738	73820009	Fluvio with pebbles, oxidized sand. Sample taken on the contact of the bedrock. Silt rich layer just above the outcrop.
09-738	73820011	Layer on the outcrop (till).
09-738	73820012	Sampled on a plateau, on the top of a big hill. Sampled on the outcrop at 0.7m. Very rich in pebble-gravel subrounded. The C layer is oxidized (B).
09-738	73820013	Sample sandy. Traces of organic stuff in the sample. Sample black-brown.
09-738	73820014	Sampled at the bottom of a hill. Very sandy, sampled in C layer.
09-738	73820015	Sampled on the outcrop. The B layer looks like a glaciolacustrine. C layer has a lot of gravel and sand and looks like a till.
09-738	73820016	Sample looks like a beach sand (Glaciofluvial or proximal glaciolacustrine). Very sandy (90% sand).
09-738	73820017	Sample looks like a beach sand (Glaciofluvial or proximal glaciolacustrine). Very sandy.
09-738	73820018	Sampled in the bottom of the hill. Traces of organic stuff in till (dark brown), sampled on the outcrop (11B).
09-738	73820019	
09-738	73820021	Melt-out till sampled under a 80cm thick Glaciofluvial layer.
09-738	73820022	Glaciofluvial or glaciolacustrine sampled in a plain, 100% sand.
09-738	73820023	Melt-out till with a lot of boulder, gravel and sand in a mild slope.
09-738	73820024	Glaciofluvial sampled on the top of mild slope on corner of lake. Sand layer is present 3 m below.
09-738	73820025	A lot of pebble with gravel and sand. Really dense forest.
09-738	73820026	Melt-out till sampled in a wooded plateau on a top of hill. Very sandy.
09-738	73820027	Melt-out till sampled directly on the bedrock. Sample lightly oxidized.
09-738	73820028	Melt-out till with pebbles, gravel, sand and silt. Sampled directly on the bedrock.
09-738	73820029	Melt-out till sampled on the slope of a hill. Sandy with a lot of boulder, pebble and gravel.
09-738	73820031	Melt-out till sampled on a hill drift. Glaciofluvial material founded 2m below this sample.
09-738	73820032	Silt and sand glaciofluvial material. Sampled on a hill drift. Silt layer sampled. Lightly more washed at the bottom.
09-738	73820033	Glaciofluvial sampled at the base of a outcropped hill. Only some pebbles. Silted. B and C mixed.
09-738	73820034	Sandy Melt-out till, pebble and gravel rich. Sampled in a weak slope.
09-738	73820035	Melt-out till sampled on an undulating plateau. Pebble and gravel rich. B2 and C mixed in the sample.
09-738	73820036	Glaciolacustrine sampled on a plain-plateau. Very sandy. B and C mixed.
09-738	73820037	Sample taken in B1 which has sand and gravel. Under B1, only clay is present.
09-738	73820038	Glaciofluvial in C layer, traces of gravel, sample taken on a weak slope. Only clay for 2-3 precedent samples.
09-738	73820039	Melt-out till with a lot of boulder, pebble, gravel and sand. Material lightly oxidized.
09-738	73820041	sampled in a material patch on an outcrop. Reworked till. Pebbles, gravel, sand rich. Coarse sand.
09-738	73820042	Sample is Glaciofluvial. Taken on outcrop. Oxidized. Presence of proximal boulders.
09-738	73820043	sampling on outcrop. Mix of Ae + organic material. Trap in outcrop with pebbles, gravel and coarse sand. Traces of silt.
09-738	73820044	Taken under tree on an outcrop. Coarse grained sand.
09-738	73820045	Melt-out till taken on a De Geer moraine.
09-738	73820046	Melt-out till taken on a De Geer moraine.
09-738	73820047	Melt-out till taken on a de Geer moraine.
09-738	73820048	Reworked till or Glaciofluvial (esker??). Lot of pebbles.
09-738	73820049	Melt-out till sandy and silty.
09-738	73820051	Glaciofluvial over a layer of very fine grained sand with minor silt. This layer is very compact.
09-738	73820052	Glaciofluvial sampled in a mild slope. Almost 100% sand.
09-738	73820053	Till with pebbles, gravel, sand and silt. Presence of De Geer moraine orthogonal with glacial flow.
09-738	73820054	Melt-out till sampled on top of a hill. Sandy. A lots of boulders and pebbles.
09-738	73820055	sampied on top of hill, sandy with silt. Lot of pebbles.
09-738	73820056	Oxidized Melt-out till. Sampled on the outcrop.
09-738	73820057	Melt-out till with pebbles, sand, gravel, silt and clay. Close to an outcrop. Melt-out till???
09-738	73820058	Till sampled on small swamp. Sandy till with boulder and pebbles. Last 30cm: sand with traces of gravel. Sampled in B and C layer, between 40 and 70cm, variable granulometry.
09-738	73820059	Sample on top of hill, sandy with a lot of pebbles and gravel.
09-738	73820061	Glaciofluvial (95% sand) taken on the boundary of outcrop. A lot of pebbles in Ah.
09-738	73820062	Sample taken in Glaciofluvial. Sandy, close to the outcrop.
09-738	73820063	sampied in Melt-out till, very sandy, close to the outcrop on the drift of the little hill.
09-738	73820064	Presence of blocks in the hole, sampled in the B layer. Very sandy and oxidized.
09-738	73820065	Presence of a lot of block in the Ae & B layer. Very sandy (coarse grained sand). Oxidized.
09-738	73820066	5-10cm of till on the outcrop (about 40cm). Very rich in sand-silt. Sand oxidized.
09-738	73820067	Sample is taken at the bottom of the hill.
09-738	73820068	Sample target than sample #73820069
09-738	73820069	Sample of 10kg.
09-738	73820071	Glaciolacustrine sand < 2mm.
09-738	73820072	sampied on the outcrop. About 20-30 cm of till.
09-738	73820073	Outcrop (gneiss). Presence of a lot of pebbles in the hole.
09-738	73820074	Saturated till, sampled on the outcrop, under a fallen tree. Very sandy. B mixed with C. Oxidized.
09-738	73820075	sampied on a de Geer moraine (320°), orthogonal to ice flow. Very sandy.
09-738	73820076	sampied on a De Geer moraine (320°), orthogonal to ice flow. Very sandy.
09-738	73820077	
09-738	73820078	
09-738	73820079	Compact till, in contact with big boulder. Very sandy. Taken in B layer.
09-738	73820081	Presence of organic stuff in the sample. Sampled on an outcrop.
09-738	73820082	Reworked till, very sandy, subrounded pebbles, no silt. Elevation = 374m.
09-738	73820083	sampied on the de Geer moraine (320°).

Project	#Sample	Comments
09-738	73820084	sampled on De Geer moraine (300-320°) orthogonal to ice flow. Very sandy.
09-738	73820085	The C layer is gray, no oxide.
09-738	73820086	Melt-out till, sandy, a lot of big boulders in B layer. Sample is a mix of B and C layers.
09-738	73820087	Taken on de Geer moraine (330°) orthogonal to ice flow.
09-738	73820088	sampled on the top of hill. Very sandy.
09-738	73820089	
09-738	73820091	Melt-out till or Glaciofluvial?? Taken on outcrop under a tree. Sandy. Only sand 2m above.
09-738	73820092	Sampled on De Geer moraine with boulder (a lot in the top), pebbles and gravel. Clay in the bottom of the hole (last 20cm). Layer with boulders and pebbles has been sampled.
09-738	73820093	Glaciolacustrine sampled in plains. Mainly clay and silt with some coarse sand and traces of gravel.
09-738	73820094	Till sampled on the side of a little hill with a lot of boulders and pebbles.
09-738	73820095	Sample taken in Glaciolacustrine material with few pebbles and gravel in a weak slope.
09-738	73820096	Sampled in glaciolacustrine with few pebbles, gravel in a layer between sand and clay. Clay is at bottom of the hole. The layer between sand and clay contain coarse grain. Oxidized.
09-738	73820097	Sample taken on the outcrop. Mix of clay, pebbles and few gravel.
09-738	73820098	Taken on side of valley with a weak slope. Take on the layers out the outcrop.
09-738	73820099	sampled on a moraine, parallel with ice flow (240°). Sandy with few gravel and pebbles. sampled between boulder. Melt-out till?
09-738	73820101	Glaciolacustrine material very sandy. Fresh material at 1m deep.
09-738	73820102	Sample of sand on the top of a hill. Sampled in B layer because it contains pebbles and gravel.
09-738	73820103	Glaciolacustrine (almost 100% sand) on the top of little hill.
09-738	73820104	Melt-out till with lot of sand. Many boulders and gravel.
09-738	73820105	Fluvio (95% sand) compact, on the top of little hill.
09-738	73820106	Melt out till with a lot of sand and silt. May have some clay. Granitoid outcrop all around the sample.
09-738	73820107	Glaciolacustrine (silt and sand) on the top of the little hill.
09-738	73820108	Glaciolacustrine sample. Outwash plain ? Very rich in gravel, just on the boundary of the road.
09-738	73820109	Glaciolacustrine with only sand and small gravel. Sample taken at about 15m from the road.
09-738	73820111	Fluvio, very rich in sand, on the boundary of the road.
09-738	73820112	Glaciolacustrine mainly composed of sand and silt taken in B layer over a silt and clay layer. Only presence of clay and silt in the surrounding area.
09-738	73820113	Oxidized layer, sampled on the outcrop. Melt-out till???
09-738	73820114	Sandy with silt and clay. Sample taken in a layer with sand, over a clay layer. Layer B oxidized.
09-738	73820115	Glaciolacustrine mainly composed of sand and silt over an argillicous layer.
09-738	73820116	Sandy, seems to be a sand bar (or a beach).
09-738	73820117	Glaciolacustrine sample that contains 100% sand. Medium to coarse grained sand.
09-738	73820118	Glaciolacustrine sample that contains 100% sand. Medium to coarse grained sand.
09-738	73820119	Melt-out till, sandy with pebbles and silt.
09-738	73820121	sampled on plateau on top of hill. Very sandy.
09-738	73820122	Presence of pebbles on the Ae layer. Presence of oxides in glaciolacustrine. Presence of glaciolacustrine at the top of the hill. Lodegment till.
09-738	73820123	sampled on plateau on top of hill. On the outcrop (1B), B mixed with Ae.
09-738	73820124	sampled on corner of outcrop.
09-738	73820125	
09-738	73820126	Sample contains traces of gravel with 5% coarse sand, 10% fine sand. Silty.
09-738	73820127	Melt-out till taken on slope of a hill. Sandy. There's only sand to the middle and more down. 10 kg
09-738	73820128	Melt-out till taken on slope of the hill. Sandy. There's only sand to the middle and more down.
09-738	73820129	Taken on a layer on the outcrop. Sample on Ae layer.
09-738	73820131	Melt-out till sampled on middle slope of the hill. Sandy.
09-738	73820132	sampled on top of hill near of outcrop. A lot of boulder in surface, very sandy, a lot of pebbles.
09-738	73820133	Glaciolacustrine or glaciolacustrine sampled upon clay layer. 0.35 deep.
09-738	73820134	sampled on top of hill. Same place as 73820135.
09-738	73820135	Same 73820134.
09-738	73820136	Melt-out till sampled on slope top of the hill. Sandy, a lot of pebbles and gravel.
09-738	73820137	sampled on top of hill. Looks like hummocky. A lot of boulders, pebbles. Very sandy. Frontal moraine?? 20m of height.
09-738	73820138	Glaciolacustrine sampled on undulating hills. Sandy. This material may be a result of frontal moraine?
09-738	73820139	sampled on top of hill. Very sandy.
09-738	73820141	Reworked till, sandy and oxidized sampled on an outcrop.
09-738	73820142	Reworked till, sandy and oxidized sampled on an outcrop.
09-738	73820143	Lodgement or melt-out till sampled on an outcrop. Silty and argillicous. Mixed with organic material.
09-738	73820144	Silty and argillicous.
09-738	73820145	Melt-out till sampled.
09-738	73820146	Glaciolacustrine overlies till
09-738	73820147	Mix of Ae and B2.
09-738	73820148	Same place as sample 73820146 over the layer where 73820146 has been sampled.
09-738	73820149	Melt-out till taken on middle slope of a hill. Presence of clay 2 m under the sampling place.
09-738	73820151	sampled on a moraine (boulder hill). reworked till or melt-out till?, with a lot of boulders, pebbles and gravel. Also sand and silt.
09-738	73820152	Melt-out till with a lot of pebbles and gravel. Grain size decrease with depth, sampled in layer with a lot of gravel between 50 and 70 cm. Oxidized.
09-738	73820153	Melt-out or washed till? Taken on top of hill, sandy with a lot of pebbles and gravel. Silt in traces (fluvio?) The grains are coarser in deep.
09-738	73820154	Melt-out till with a layer of Glaciolacustrine under the till. Glaciolacustrine at about .8m deep.
09-738	73820155	sampled near of an outcrop. Presence of organic material. B layer sampled. Very wet.
09-738	73820156	Melt-out till sandy with pebbles and gravel. Also silt. Taken in a plain.
09-738	73820157	Melt-out till sampled on an outcrop in B layer. Oxidized.
09-738	73820158	Melt-out till? Clay and silt with pebble and gravel. May be Melt-out till.
09-738	73820159	Melt-out till with a few organic material in B layer.
09-738	73820161	Melt-out till sampled on corner of small hill in plain. Saturated. Sandy with a lot of pebbles.
09-738	73820162	sampled on outcrop. Very oxidized and sandy. Presence of organic material.
09-738	73820163	sampled on outcrop. Very oxidized and sandy. Presence of organic material. 10kg.
09-738	73820164	sampled on a middle slope of boulders hill. There are a clay basement around this hill. May be a glacial formation.
09-738	73820165	Glaciolacustrine taken between 0.2 and 0.3m. The rest is the clay.
09-738	73820166	Melt-out till sampled in De Geer moraine on lacustrine material.

Project	#Sample	Comments
09-738	73820167	
09-738	73820168	Sample taken on outcrop. Silty, few pebble and gravel. Glaciolacustrine or till?
09-738	73820169	Bad drainage. Taken on plateau on the undulating relief.
09-738	73820171	Melt-out till. Sand with pebbles, gravel and silt.
09-738	73820172	Melt-out till with a lot of boulders, pebbles and gravel. Traces of silt.
09-738	73820173	Melt-out till very sand rich. Some boulders and pebbles. Taken on an elongated hill (moraine?).
09-738	73820174	Glaciolacustrine or fluvial origin with finely grained sand and silt. Few gravel in Ae layer.
09-738	73820175	Thin C layer (1-2 cm) on bedrock. The sample is a mix of B and C layers. Melt-out till with boulders, pebbles, gravel, sand and silt. A lot of silt and traces of clay.
09-738	73820176	Melt-out till or lodgement till? silt and clay. Sample is very badly sorted. May be a Melt-out till.
09-738	73820177	Same as 73820176 (10kg) B mixed with C because there was too much water flooding the hole.
09-738	73820178	Melt-out till with pebbles, gravel and silt. Sand rich.
09-738	73820179	Melt-out till sandy with pebbles and gravel.
09-738	73820181	Melt-out till with a lot of boulders, pebbles and gravel. Traces of silt. Coarse grained sand.
09-738	73820182	Melt-out till with a lot of boulders. Coarse grained sand.
09-738	73820183	Melt-out till with a lot of boulders.
09-738	73820184	Melt-out till with a lot of boulders. Coarse grained sand.
09-738	73820185	Melt-out till with a lot of boulders, pebbles and gravel. sampled in B layer.
09-738	73820186	Lodgement or melt-out till? A lot of silt. Taken between two outcrops.
09-738	73820187	Melt-out till taken directly on the outcrop in the C layer, just above the outcrop.
09-738	73820188	Taken with some organic material in B layer. Sample is oxidized, directly on the bedrock.
09-738	73820189	Melt-out till taken in C layer with a bit of B layer, directly on the bedrock.
09-738	73820191	Melt-out till sample at 20m of an outcrop zone. Some boulders and pebbles. A lot of sand.
09-738	73820192	sampled on an outcrop, in B layer. Presence of organic stuff.
09-738	73820193	Melt-out till with pebbles, gravel sand and silt, sampled in what looks like a moraine.
09-738	73820194	Melt-out till with big boulders.
09-738	73820195	Melt-out till with few pebbles and gravel mixed up with organic material.
09-738	73820196	Melt-out till sample at bottom of a big outcrop. Very oxidized.
09-738	73820197	Melt-out till with a few organic material. sampled directly on the bedrock.
09-738	73820198	Melt-out till with a lot of boulders and pebbles. sampled directly on the bedrock.
09-738	73820199	Melt-out till in a frontal moraine. Very sandy with few pebbles and gravel.
09-738	73820201	Mix between B and C because the hole was flooding. Outcrop just beside the sample.
09-738	73820202	Layer thickness was impossible to determine. Too much water in the hole. Organic material present in the sample. Material is oxidized.
09-738	73820203	Melt-out till (melt-out?) taken directly on the bedrock, behind an outcrop.
09-738	73820204	Melt-out till with a lot of silt.
09-738	73820205	Melt-out till taken directly on the bedrock on top of a hill. A lot of boulders!
09-738	73820206	Melt-out till taken directly on the bedrock on top of a hill. A lot of boulders!
09-738	73820207	Melt-out till oxidized with a lot of boulders. B+C because water was flooding in the hole.
09-738	73820208	Coarse grained sand with few gravel.
09-738	73820209	Melt-out till.
09-738	73820211	Gps point = +/- 20m precision.
09-738	73820212	sampled on the outcrop. Very sandy.
09-738	73820213	Very sandy. 0.3 to 0.4m boulders.
09-738	73820214	Very sandy. A lot of boulders.
09-738	73820215	Presence of organic material in sample. Mix of B and C layer. sampled on outcrop.
09-738	73820216	sampled on outcrop. Taken in B layer. Précision du GPS de +/- 21m.
09-738	73820217	sampled under a fallen tree on the outcrop. Not much till. Sample = B + C. 10kg.
09-738	73820218	sampled under a fallen tree on the outcrop. Not much till. Sample = B + C.
09-738	73820219	sampled on outcrop. A lot of organic stuff. Taken in B layer. Isn't a good sample...
09-738	73820221	Close to a lake.
09-738	73820222	Sampled in Glaciofluvial. No till.
09-738	73820223	Sandy till
09-738	73820224	Glaciofluvial or reworked till. Very sandy. Took till over sandy layer.
09-738	73820225	Glaciofluvial or reworked till. Very sandy. Took till over sandy layer.
09-738	73820226	Glaciofluvial or reworked till. Very sandy. Lot of boulder in Ah layer and in B layer.
09-738	73820227	Sample in glaciofluvial. very sandy.
09-738	73820228	Glaciofluvial or reworked till. Very sandy. A lot of boulders and pebbles in Ah and B layer.
09-738	73820229	Glaciofluvial or moraine. Lot of gravel. Very sandy.
09-738	73820231	Very sandy (90% sand). Glaciofluvial.
09-738	73820232	Sample in glaciofluvial. No till observed around. Very sandy.
09-738	73820233	Very sandy (85% sand). No till observed around. Sample in glaciofluvial.
09-738	73820234	Very sandy with lot of gravel at 1m. No till observed around. Sample in glaciofluvial.
09-738	73820235	Very sandy with lot of gravel at 1m. No till observed around. Sample in glaciofluvial.
09-738	73820236	Very sandy. No gravel. No till observed around. One big boulder observed. Sample in glaciofluvial.
09-738	73820237	Sample in reworked till, moraine or glaciofluvial with pebbles. Very sandy.
09-738	73820238	Very sandy. No till observed around. Probably glaciofluvial, maybe moraine.
09-738	73820239	Very sandy. No till observed around. Probably glaciofluvial, maybe moraine.
09-738	73820241	Very sandy (80% sand). No till observed around. Probably glaciofluvial.
09-738	73820242	Very sandy (90% sand). No till observed around. Probably glaciofluvial.
09-738	73820243	Very sandy. Probably glaciofluvial, maybe moraine. Presence of pebbles and boulders in 30 first centimeters.
09-738	73820244	Fine grained sand (90%). Probably glaciofluvial. No till observed around.
09-738	73820245	Sample of till in hill.
09-738	73820246	Sample took on top of hill. A lot of outcrop around. Lot of boulder in Ae layer.
09-738	73820247	Lot of outcrop under vegetation. Sample took close to a paragneiss outcrop.
09-738	73820248	Sample took on top of hill. A lot of boulder in Ae and B layer. Very sandy.

Project	#Sample	Comments
09-738	73820249	Sample took downhill. Lot of blocks (granitoides). Sample in till (B layer) over a sandy layer (glaciofluvial), till probably coming from the hill.
09-738	73820251	Silty. Glaciocluvial or glaciolacustrine???
09-738	73820252	Melt-out till sandy sampled in middle slope.
09-738	73820253	Oxidized. Taken on the layer just above outcrop.
09-738	73820254	Melt-out till sampled at proximity of outcrop. Saturated.
09-738	73820255	top of a hill. Oxidized.
09-738	73820256	Melt-out till sampled in dense Forest. 10Kg
09-738	73820257	Melt-out till sampled in plains. Sandy.
09-738	73820258	Melt-out till sampled on middle slope of a hill.
09-738	73820259	Lodgement or melt-out till sampled on outcrop, hill top. Silty and argillaceous.
09-738	73820261	Sandy fine grained with micas. The C layer was grey and brown.
09-738	73820262	Mix between B and C because the hole was flooding.
09-738	73820263	Layer C was mixed up with thin layer oxidized.
09-738	73820264	Sample took in B layer because of flooding, sandy but sample took in a coarse grain layer with sand and gravel. Maybe glaciocluvial.
09-738	73820265	
09-738	73820266	Clay in the bottom of the hole. Sample in sandy with few gravel. Intervals of oxidized and non oxidized stripes. Mix of B and C layer because hole is flooded.
09-738	73820267	till is very silty in the bottom. Sample took in the upper part of this silty till.
09-738	73820268	sand deposit. Glaciocluvial or lacustrine origin ? Sample took in fine to coarse grain sand.
09-738	73820269	Sample took in the slope of a hill.
09-738	73820271	Sample took under a three in B layer. Oxidized.
09-738	73820272	Sample took under a three. Outcrop observed look like metasediments foliated and are locally oxidized.
09-738	73820273	Lot of pebbles and gravel.
09-738	73820274	Sample in glaciolacustrine.
09-738	73820275	Sample in glaciolacustrine.
09-738	73820276	Sample took on a De Geer? in a swamp sector. De Geer is oriented approximatively 270-290, giving a perpendicular glacial flow.
09-738	73820277	Sandy till.
09-738	73820278	Sample took on top of a hill, under a three.
09-738	73820279	Sample on top of a small isolated hill. Very sandy.
09-738	73820281	Glaciocluvial sample is very sandy (90%).
09-738	73820282	Sample in B layer of glaciolacustrine.
09-738	73820283	Sample took on a little hole. A lot of glaciolacustrine around.
09-738	73820284	Sample took under a fallen three. Lot of pebbles.
09-738	73820285	Sample in a mix of B and C layer. Very sandy.
09-738	73820286	Very sandy till (90%). Maybe glaciocluvial.
09-738	73820287	Till took near of outcrop. Very sandy.
09-738	73820288	Till took near of outcrop. Very sandy.
09-738	73820289	Sample took at the bottom of a hill.
09-738	73820291	
09-738	73820292	Sample took on top of the hill.
09-738	73820293	Sample in slopes of a small hill. Very sandy (75% sand).
09-738	73820294	Sample on top of a small hill. Very sandy (75% sand).
09-738	73820295	Sample in glaciolacustrine very fine grained. No till around.
09-738	73820296	Took on top of a hill. A lot of boulders and pebbles.
09-738	73820297	Took in B layer at 1.0 m. Lot of pebbles and boulders.
09-738	73820298	A lot of pebbles and boulders in B layer.
09-738	73820299	Sample in a slope of a hill. Lot of boulders and pebbles in B layer.
09-738	73820301	Glaciocluvial or glaciolacustrine origin ? sampled on an elongated hill.
09-738	73820302	Glaciocluvial or glaciolacustrine, finely grained sand with silt and traces of clay.
09-738	73820303	Reworked till on a De Geer moraine (360°). No silt.
09-738	73820304	Melt-out till with a lot of boulders sampled in the slope of a hill.
09-738	73820305	Oxidized. Undulating deposit.
09-738	73820306	Melt-out till sampled in the slope of a hill.
09-738	73820307	Sample as 73820306, 10kg.
09-738	73820308	Glaciocluvial 100% sand.
09-738	73820309	100% sand.
09-738	73820311	Sample took in B layer above a clay layer.
09-738	73820312	Triangular shaped pebbles took on top of the hill.
09-738	73820313	Boulders with triangular shapes. Melt-out till took on top of hill. Sample took in B layer on bedrock.
09-738	73820314	Low altitude for Melt-out till.
09-738	73820315	Sample took in B layer above clay layer. Presence of organic material.
09-738	73820316	Sample took on top of the hill.
09-738	73820317	Beautiful.
09-738	73820318	Melt-out till with coarse grain sand and lot of pebbles and boulders.
09-738	73820319	Sample took near a swamp. Look like a small moraine.
09-738	73820321	Sample took in a De Geer moraine.
09-738	73820322	Beautiful.
09-738	73820323	
09-738	73820324	B Layer is difficult to distinguish.
09-738	73820325	Melt-out till with lot of boulders, pebbles and coarse sand.
09-738	73820326	Melt-out till with lot of boulders, pebbles and coarse sand.
09-738	73820327	Melt-out till with clay and till.
09-738	73820328	Sandy Melt-out till.
09-738	73820329	Distinction between Ae, B and C layer is difficult. Iron layer? Probably in layer B or C. Saturated.
09-738	73820331	Melt-out till sampled on middle of weak slope. Sandy with a lot of pebbles.
09-738	73820332	Reworked till or Glaciocluvial. Sandy with a lot of pebbles and gravel.

Project	#Sample	Comments
09-738	73820333	Reworked till or Glaciofluvial. Sandy with a lot of pebbles and gravel. 10kg
09-738	73820334	Reworked till or Glaciofluvial sampled on corner of outcrop. Only sandy surrounded. Sampled on the bedrock.
09-738	73820335	Glaciofluvial sample. Clay after 30cm in hole.
09-738	73820336	Glaciofluvial or glaciolacustrine origin sample. the middle of slope of hill.
09-738	73820337	Glaciofluvial or glaciolacustrine sampled on base of outcrop. Coarse sand 15%.
09-738	73820338	Melt-out till or Glaciofluvial. Sand is very fine. Sampled on top of a hill.
09-738	73820339	Glaciofluvial taken on plain on the corner of a swamp. Fine sand.
09-738	73820341	Very sandy with a lot of boulders and pebbles.
09-738	73820342	Lot of boulders, saturated.
09-738	73820343	Very sandy. Reworked till or glaciofluvial?
09-738	73820344	Very sandy and silty.
09-738	73820345	Sampled on top of de The Geer moraine.
09-738	73820346	Glaciofluvial or reworked till. A lot of pebbles and gravel, sampled in middle slope of outcrop.
09-738	73820347	Very sandy. Coarse sand.
09-738	73820348	Lodgement or melt-out till taken on bedrock. Silty and clayey.
09-738	73820349	Lodgement or melt-out till taken on bedrock. Silty.
09-738	73820351	100% sand.
09-738	73820352	98% sand 2% gravel.
09-738	73820353	sandy.
09-738	73820354	Sandy.
09-738	73820355	Glaciofluvial with 95% sand.
09-738	73820356	On the bedrock.
09-738	73820357	On the bedrock. 10kg.
09-738	73820358	100% fine sand.
09-738	73820359	100% sand. The C layer is lightly mixed with B.
09-738	73820361	Drumlin?
09-738	73820362	Presence of roots in the sample. Glaciolacustrine or Glaciofluvial. Sand is very fine.
09-738	73820363	de Geer moraine.
09-738	73820364	sampled on a small moraine. Only glaciolacustrine around the moraine.
09-738	73820365	Glaciofluvial sampled in B layer because grains were coarser than C layer.
09-738	73820366	Glaciolacustrine sample with a lot of silt and clay.
09-738	73820367	Very sandy, located near a moraine landform?
09-738	73820368	Very sandy
09-738	73820369	Sandy.
09-738	73820371	Till in slope of a hill. Very sandy and lot of gravel.
09-738	73820372	Very sandy. Took close to a metric size boulder. Sand is present all around.
09-738	73820373	Sample in glaciofluvial. No till observed around.
09-738	73820374	Took on the outcrop. Very sandy.
09-738	73820375	Many outcrops of granite at S-W. Lot of big boulders and pebbles. Cannot go deeper than 0.6 metres.
09-738	73820376	Very sandy. Sample in a mix of B and C layer. Lot of pebbles and boulders.
09-738	73820377	Sample took on a small till close to a swamp.
09-738	73820378	Alternance of layers red-brown and brown-beige in B and C layer.
09-738	73820379	A lot of fine grained sand and silt. Very wet.
09-738	73820381	Maybe glaciofluvial. The material is compact, sandy and silty.
09-738	73820382	Very sandy and silty. Very wet.
09-738	73820383	Very sandy and silty. Very wet.
09-738	73820384	Sample took in saturated B layer under a fallen tree in a swamp. No dry till around.
09-738	73820385	Sample took in B layer saturated. No dry till around.
09-738	73820386	Non-saturated till on a small hill.
09-738	73820387	Non-saturated till on a small hill.
09-738	73820388	Sample took on de Geer moraine. Very sandy.
09-738	73820389	Till took on a small hill in a dense forest.
09-738	73820391	Sandy. 10kg., Same 73820369
09-738	73820392	Melt-out till with a lot of boulders.
09-738	73820393	100% sand.
09-738	73820394	Melt-out till with a lot of boulders, pebbles and gravel. Taken on what looks like a de Geer moraine. Material is oxidized.
09-738	73820395	Melt-out till? Very badly sorted.
09-738	73820396	100% fine grained sand.
09-738	73820397	Very sandy.
09-738	73820398	
09-738	73820399	Same as 73820398, 10kg.
09-738	73820401	Nice till took in the side of an outcrop hill. Triangular shape pebbles.
09-738	73820402	Sandy Melt-out till with coarse grain sand and gravel. Sample took in B layer with a bit of C layer because the hole was flooding.
09-738	73820403	Melt-out till with coarse grain sand and lot of gravel. A little bit of B layer in the sample.
09-738	73820404	Melt-out till with coarse grain sand and lot of gravel. A little bit of B layer in the sample.
09-738	73820405	
09-738	73820406	Sample took on side of an outcrop, directly on the outcrop in B layer.
09-738	73820407	Melt-out till. Could be a lodgement till.
09-738	73820408	Melt-out till. Could be a lodgement till.
09-738	73820409	
09-738	73820411	Same as 73820259, 10kg.
09-738	73820412	Lodgement or melt-out till taken on outcrop. Silty and argilaceous.
09-738	73820413	Lodgement or melt-out till sampled on base of outcrop cap. Oxidized. Presence of organic material.
09-738	73820414	Melt-out till sampled on middle of slope of a hill. Only sandy 3m above.
09-738	73820415	Melt-out till sampled on top of hill. A lot of boulders on surface.

Project	#Sample	Comments
09-738	73820416	Lodgelement or melt-out till? Taken on the bedrock. Silty and argillaceous. Mix of B and C.
09-738	73820417	Sample taken on outcrop. Silty and clayey
09-738	73820418	Glaciocluvial or glaciolacustrine taken on small hill in swamp area.
09-738	73820419	Lodgelement or melt-out till taken on bedrock on top of outcrop cap.
09-738	73820421	Sample took on a plateau. Very sandy and very dense forest cover.
09-738	73820422	Sample took in a swamp. Saturated B layer sampled.
09-738	73820423	Sample took in a swamp. No dry till around.
09-738	73820424	Sample took in a De Geer moraine. Very sandy.
09-738	73820425	Sample took in a De Geer moraine. Very sandy.
09-738	73820426	Sample took on a plateau. Very dense forest cover. Lot of boulders in Ae and B layer. Till is very sandy.
09-738	73820427	Sample took in glaciocluvial? Very sandy.
09-738	73820428	Very sandy.
09-738	73820429	Sample in a mix of B and C layer.
09-738	73820431	Very sandy. Lot of boulder in Ae layer and in B layer.
09-738	73820432	Very sandy. Lot of boulder in Ae layer and in B layer.
09-738	73820433	Beautiful.
09-738	73820434	Took on outcrop. Material is oxidized. No C layer, B layer being directly on outcrop.
09-738	73820435	Sample took down a granite hill. Very sandy.
09-738	73820436	Sample took down a granite hill. Very sandy.
09-738	73820437	Sample at base of a hill. Melt-out till (till de fond). Lot of silt and clay.
09-738	73820438	Glaciocluvial or frontal moraine. Very sandy (90% sand).
09-738	73820439	Sample at top of a small hill. Lot of boulders and pebble in Ar and B layer.
09-738	73820441	Lodgelement or melt-out till taken on bedrock. Silty. Taken in a trap on outcrop.
09-738	73820442	Fine grained sand.
09-738	73820443	Fine grained sand.
09-738	73820444	Taken on bedrock. Coarse grained sand.
09-738	73820445	Same as 73820444, 10kg.
09-738	73820446	Top of B layer sampled because presence of pebbles and gravel. C layer only composed of fine sand.
09-738	73820447	Sampled on a De Geer moraine (oriented N150°). Coarse grained sand.
09-738	73820448	Sampled on a De Geer moraine, silty.
09-738	73820449	Sampled on a de Geer moraine (oriented N150°). Silty.
09-738	73820451	Melt-out till?
09-738	73820452	Glaciolacustrine sampled far away from the target because target was in a swamp.
09-738	73820453	Very sandy. Few boulders.
09-738	73820454	Very gravel-rich Melt-out till.
09-738	73820455	Sandy.
09-738	73820456	Sandy. Medium grained sand.
09-738	73820457	sampled in B layer. A lot of organic material.
09-738	73820458	Sandy.
09-738	73820459	Material well oxidized. Organic material.
09-738	73820461	Really oxidized. Taken directly on the bedrock.
09-738	73820462	The till sampled is very sandy and under a layer with a lot of boulder.
09-738	73820463	Porphyry boulders in hole. Lightly mixed with oxidized material. Taken close to an outcrop.
09-738	73820464	Sandy till. Sample is lightly oxidized.
09-738	73820465	B layer + C in the sample. Taken on an outcrop. A lot of gravel in it.
09-738	73820466	Gravel-rich Melt-out till with a lot of boulders. Material oxidized. Saturated.
09-738	73820467	C mixed with B layer
09-738	73820468	Same as 73820467, 10kg.
09-738	73820469	Melt-out till taken on an elongated hill (De Geer moraine? N005)
09-738	73820471	Sand is coarse.
09-738	73820472	Very oxidized. 10% coarse sand.
09-738	73820473	B layer sampled, sandy because the C layer is composed of clay.
09-738	73820474	Coarsed sand.
09-738	73820475	B layer sampled, sandy because the C layer is composed of clay.
09-738	73820476	B layer sampled, sandy because the C layer is composed of clay.
09-738	73820477	Sampled oxidized.
09-738	73820478	Silty, sampled on base of hill. Only sand 3m deeper.
09-738	73820479	Sampled on bedrock in a trap.
09-738	73820481	Possibly a De Geer moraine.
09-738	73820482	Same as 73820461, 10kg.
09-738	73820483	Melt-out till taken beside an rocky outcrop hill.
09-738	73820484	Same as 73820483, 10kg.
09-738	73820485	Clos of trap. Sandy.
09-738	73820486	100% sand, taken on a small hill.
09-738	73820487	Same as 73820486, 10kg.
09-738	73820488	Glaciolacustrine with angular boulders and gravel that probably come from outcrop.
09-738	73820489	Glaciolacustrine sampled in a slope. A lot of clay.
09-738	73820491	Sandy. Medium to coarse sand with few gravel.
09-738	73820492	Sample took off a side of the hill. Very compact. Under a sandy layer. Oxydized. Pebbles very angular.
09-738	73820493	Sample took on top of an outcrop hill. Melt-out till with a lot of silt and clay.
09-738	73820494	Melt-out till took on top of a hill.
09-738	73820495	Sample took in a moraine? Very heterogeneous in composition.
09-738	73820496	Till with a lot of clay and silt.
09-738	73820497	Sample took in a moraine.
09-738	73820498	Sand layer over a clay layer.

Project	#Sample	Comments
09-738	73820499	Sand layer over a clay layer.
09-738	73820501	Glaciofluvial. No till around. Very sandy (90% sand).
09-738	73820502	Very sandy. Took in B layer.
09-738	73820503	Very sandy. Took in B layer.
09-738	73820504	Lot of boulders in A <sub>e</sub> and B layer. Coarse grain sand. Very sandy. Mix of B and C layer.
09-738	73820505	Sample of the hill with steep slope. Till with organic matter in B layer.
09-738	73820506	Lot of outcrop around. Lot of boulders on surface. Very sandy.
09-738	73820507	Sample on the outcrop, sampled on a plateau at top of the hill.
09-738	73820508	Sample on the outcrop. Many boulders are angular to subangular.
09-738	73820509	Sample took in slope of the hill. Look like lodgement till.
09-738	73820511	Sample took in a saturated swamp.
09-738	73820512	Sample took in a saturated swamp.
09-738	73820513	Lot of gravel. Took on the outcrop. Took in oxydize layer.
09-738	73820514	Very sandy (coarse grained). Maybe glaciofluvial.
09-738	73820515	Took on the outcrop, in B layer (oxydized).
09-738	73820516	Lot of boulders (boulders field). Sample took down hill. Presence of organic matter.
09-738	73820517	Took close to outcrop. Very sandy. Took in C layer. Very dense forest cover.
09-738	73820518	Outcrops close to surface. Sample took in a swamp close to the base of an outcrop.
09-738	73820519	Very sandy. Oxydized.
09-738	73820521	Argilaceous and silty, taken on a small hill.
09-738	73820522	Very sandy, taken in middle of slope.
09-738	73820523	Sampled in middle of slope of big hill.
09-738	73820524	Sandy with a lot of pebbles and gravel.
09-738	73820525	Sample oxydized. A lot of pebbles, gravel and boulders.
09-738	73820526	Same as 73820525.
09-738	73820527	A lot of boulders, pebbles and gravel.
09-738	73820528	Sample taken on hill. Fine sand. Oxydized.
09-738	73820529	Melt-out till with a lot of pebbles. Silty.
09-738	73820531	Block field. Lot of boulders and pebbles.
09-738	73820532	Lodgement till ?
09-738	73820533	Very sandy.
09-738	73820534	Sampled on the outcrop
09-738	73820535	Lot of pebbles.
09-738	73820536	Taken in B layer, a lot of boulders in A and B layer. Very sandy.
09-738	73820537	Sampled in slope of hill.
09-738	73820538	Sampled in glaciofluvial in slope of hill. Very sandy.
09-738	73820539	Very sandy. New target for #318. On top of little hill.
09-738	73820541	Lightly mixed with oxydized material.
09-738	73820542	Melt-out till with a lot of boulders taken in the slope of a ridge.
09-738	73820543	Presence of a lot of clay.
09-738	73820544	Melt-out till or Glaciofluvial with a lot of boulders taken in a terraced.
09-738	73820545	Glaciolacustrine with a lot of clay in it.
09-738	73820546	Glaciolacustrine sampled.
09-738	73820547	Glaciolacustrine sampled in the top of a weak slope.
09-738	73820548	Very sandy.
09-738	73820549	Very sandy. Taken between two outcrops.
09-738	73820551	A lot of boulders, taken beside an outcrop.
09-738	73820552	Melt-out till with fine grained sand.
09-738	73820553	Same as 73820552, 10kg.
09-738	73820554	Melt-out till sampled in B layer because C layer was only composed of fine grained sand.
09-738	73820555	Melt-out till taken directly on an outcrop. Very oxydized (B layer). A little bit of C layer was also sampled.
09-738	73820556	Same as 73820555, 10kg.
09-738	73820557	Glaciofluvial sampled up of a slope on a plateau. 100% sand.
09-738	73820558	Sandy, few pebbles.
09-738	73820559	Melt-out till with a lot of big boulders.
09-738	73820561	Sand layer over a clay layer.
09-738	73820562	Sand layer over a clay layer.
09-738	73820563	Medium to coarse grained sand.
09-738	73820564	Medium to coarse grained sand.
09-738	73820565	Seems to be a big sand bar.
09-738	73820566	
09-738	73820567	sampled in a moraine lost in a clay sea!
09-738	73820568	
09-738	73820569	
09-738	73820571	Sandy, oxydized.
09-738	73820572	Fine sand.
09-738	73820573	Sandy.
09-738	73820574	Sampled on bedrock in a trap
09-738	73820575	Same as 73820574, 10kg.
09-738	73820576	Glaciolacustrine.
09-738	73820577	Taken on small hill surrounded by swamp.
09-738	73820578	Taken on small hill on corner of lake. Sampled in B layer.
09-738	73820579	Taken on bedrock cap in a trap. Silty.
09-738	73820581	Same as 73820539, 10kg.

Project	#Sample	Comments
09-738	73820582	Sampled in till small hill. Lot of boulders and pebbles.
09-738	73820583	Sampled on a small till hill in a swamp sector.
09-738	73820584	Sampled on peninsula.
09-738	73820585	sampled at bottom of small hill, on an outcrop. Very sandy.
09-738	73820586	Sampled in glaciofluvial or glaciolacustrine in B layer, saturated.
09-738	73820587	sampled on a small plateau surrounded by swamp. Very sandy. Fine grained sand.
09-738	73820588	Taken in slope of hill close to an outcrop. Very sandy. A lot of pebbles and boulders in Ae and B layer.
09-738	73820589	Sampled in Glaciofluvial or glaciolacustrine material, very sandy.
09-738	73820591	
09-738	73820592	Lot of boulders and pebbles in B layer. Very sandy. Maybe a moraine or reworked till.
09-738	73820593	Same as 73820592, 10kg.
09-738	73820594	Sampled in sandy till on top of an undulation. Very sandy.
09-738	73820595	Closely on an outcrop. Taken in B layer, over C layer (glaciolacustrine).
09-738	73820596	Taken on top of hill. Brown-red and lighter layers interbedded.
09-738	73820597	Taken in slope of hill, a lot of boulders and pebbles in B layer. Taken on an outcrop.
09-738	73820598	Small till layer at surface (B layer). The C layer seems to be glaciolacustrine. 2.5kg.
09-738	73820599	Same as 73820598, 10kg.
09-738	73820601	sampled on a moraine with a lot of boulders.
09-738	73820602	Melt-out till taken on a side of a moraine. Sandy.
09-738	73820603	sampled on a hill with a lot of fallen trees. Mix between B and C layers.
09-738	73820604	Sandy (65%).
09-738	73820605	Lot of pebbles.
09-738	73820606	Sandy.
09-738	73820607	Sandy 10kg.
09-738	73820608	Sandy (80%). Melt-out till because of the compactness but maybe Glaciofluvial.
09-738	73820609	Sandy.
09-738	73820611	Taken at base of small slope. Sandy and silty.
09-738	73820612	Maybe a de Geer moraine (N105).
09-738	73820613	Melt-out till sampled at base of small hill. Sandy and silty.
09-738	73820614	Melt-out till, silty.
09-738	73820615	Melt-out till silty with fine sand. Taken on De Geer moraine?
09-738	73820616	Melt-out till taken on a De Geer moraine(N150)? Sandy, a lot of boulders and pebbles.
09-738	73820617	Silty.
09-738	73820618	Same as 73820617, 10kg.
09-738	73820619	Melt-out till taken at base of a De Geer moraine.
09-738	73820621	Lot of pebbles.
09-738	73820622	Reworked till with medium to coarse grained sand. Taken on a hill of the same material with a lot of big boulders.
09-738	73820623	Mainly composed of boulders and sand. Taken in B layer. Very oxidized.
09-738	73820624	Melt-out till taken on a moraine. A lot of boulders, pebbles and gravel. Nice till!
09-738	73820625	Same as 73820624, 10kg.
09-738	73820626	Taken on moraine. Sandy with a lot of boulders.
09-738	73820627	Melt-out till sampled on a side of moraine in the slope. A lot of angular boulders.
09-738	73820628	Taken in B layer on the outcrop. Induration.
09-738	73820629	Melt-out till with a lot of gravel. Oxidized.
09-738	73820631	Melt-out till taken just at the base of a hill of till with a lot of big boulders and sand. Oxidized.
09-738	73820632	Oxidized.
09-738	73820633	Glaciofluvial with some angular gravel.
09-738	73820634	C layer mixed with B layer. Presence of organic material.
09-738	73820635	A lot of big boulders all around the sampling area.
09-738	73820636	Taken on the layer of very silty material and compact.
09-738	73820637	Melt-out till taken at the base of a hill. Material oxidized taken at the limit between B and C layers.
09-738	73820638	Till with a lot of sand and silt.
09-738	73820639	Oxidized. Taken in B layer between big boulders.
09-738	73820641	Sampled in Glaciofluvial near the top of hill.
09-738	73820642	Sampled in a valley between two hills.
09-738	73820643	Sampled in a boulder field.
09-738	73820644	sampled in slope of a small hill. Lot of boulders.
09-738	73820645	Sampled in a boulders field. Lot of boulders.
09-738	73820646	Very sandy till.
09-738	73820647	Silty till. Small B layer + Ae layer.
09-738	73820648	Very sandy. Taken in slope of hill.
09-738	73820649	sampled close to an outcrop in slope of hill. Very sandy.
09-738	73820651	Taken on a De Geer moraine, very silty and sandy. Lot of pebbles in B layer.
09-738	73820652	Sampled on the outcrop at 5m. Traces of organic material in sample.
09-738	73820653	Sample taken in a moraine (banc d'emprunt).
09-738	73820654	Sample taken in a moraine. Very sandy. Taken in a 3-5 years old cutting trees sector.
09-738	73820655	sampled on a small slope. Very silty till.
09-738	73820656	Sampled in glaciolacustrine material close to a parking.
09-738	73820657	Same as 73820658, 10kg.
09-738	73820658	sampled at base of a granitic hill.
09-738	73820659	Sampled in Beach sand in darker layer.
09-738	73820661	Silty and sandy till.
09-738	73820662	Silty and sandy till.
09-738	73820663	Reworked or melt-out till? On bedrock or lacustrine with pebbles and gravel deposit? diamictite?
09-738	73820664	10% coarse grained sand.

Project	#Sample	Comments
09-738	73820665	Sample is silty and argilaceous. Maybe a melt-out till on bedrock.??
09-738	73820666	Mix of B and C layers. Sandy.
09-738	73820667	Melt-out till sandy taken at base of hill.
09-738	73820668	Oxidized sample, 10% coarse grained sand. Glaciolacustrine sample ?
09-738	73820669	10% coarse grained sand. Oxidized.
09-738	73820671	sampled between an outcrop and a swamp.
09-738	73820672	Sampled on bedrock. Silty.
09-738	73820673	sampled at base of a interlobate moraine?, at the base of a sandy hill (10m).
09-738	73820674	Sampled at base of big hills. Sandy and oxidized.
09-738	73820675	Sandy and oxidized.
09-738	73820676	Fine sand. Oxidized.
09-738	73820677	Glaciolacustrine with some pebbles and gravel angular. Taken behind an outcrop cap.
09-738	73820678	10% coarse grained sand.
09-738	73820679	Same as 73820663, 10kg.
09-738	73820681	Taken on an outcrop. Only outcrops in this zone.
09-738	73820682	
09-738	73820683	Material oxidized.
09-738	73820684	Same as 73820683, 10kg.
09-738	73820685	Sandy.
09-738	73820686	Sandy and silty.
09-738	73820687	Oxidized.
09-738	73820688	Taken directly on the outcrop. Oxidized.
09-738	73820689	Lot of gravel and silt.
09-738	73820691	Sandy, medium to coarse grained sand.
09-738	73820692	Lot of gravel and coarse sand.
09-738	73820693	sampled directly on the bedrock, difficult to distinguish B from C.
09-738	73820694	Mix between B and C taken directly on the outcrop. Melt-out till?
09-738	73820695	sampled between two outcrops, compact, lot of silt and clay.
09-738	73820696	sampled near outcrop, in a trap.
09-738	73820697	10kg.
09-738	73820698	Sandy and silty.
09-738	73820699	Sampled in sandy and silty till on a small undulation into a swamp. Melt-out till.
09-738	73820701	Glaciofluvial with 100% sand.
09-738	73820702	Same as 73820701, 10kg.
09-738	73820703	Sampled in a moraine Glaciofluvial
09-738	73820704	Glaciolacustrine sampled.
09-738	73820705	Fine sand.
09-738	73820706	Coarse grained sand. Ae and B layers mixed.

## APPENDIX 3: HEAVY MINERAL SAMPLE PROCESSING

### MINERALOGICAL SAMPLE PROCESSING IV

Primary sieving	IV
Primary gravity concentration	IV
Secondary sieving	IV
Secondary gravity separation	V
Hand magnet separation	V
Frantz magnetic separation	V

### QUALITY CONTROL FOR HEAVY MINERAL PROCESSING VI

*Table 1: Wet sieving, shaking preconcentration table and dry sieving*

*Table 2: Falcon's gravity separator*

*Table 3: Magnetic separation and quality control*

*Table 4: Notes and comment*

## MINERALOGICAL SAMPLE PROCESSING

Processing of samples dedicated to mineralogical studies followed standard procedure implemented in IOS Services Géoscientifiques inc. laboratory (**figure 6**), along with tight quality control. The purpose of this sample processing has been to concentrate heavy minerals in <250 microns, in order to extract gold grain.

### PRIMARY SIEVING

Samples were sieved by hand in a screen stack at 1000, 2000 and 9500 microns. Water spray is used on a stack of standard 18" brass and steel sieves mounted on top of a decanting tub. Sand and silt (<1000 microns) are recovered by draining the tub and stored in pails pending processing on shaking table. Pebbles larger than 9.5 mm are weighed and usually stored in prevision of pebble counting. Other fractions are drained, weighed wet (**appendix 3, table 1**) and stored according to client indications. Sieves are cleaned with a brass brush between each sample and stucked grains individually poked with a needle.

Since none of the samples were cohesive, there was no need to liquefy with a drill mixer and or to add calgon to free clay pellets.

A 200 grams witness aliquot of material was collected, dried and stored at IOS facilities pending client decision.

### PRIMARY GRAVITY CONCENTRATION

The 0-1000 microns fraction is processed on a shaking table. The model used is derived from a Wilfley table, with a custom-built deck carved out of a Plexiglass sheet. A hydraulic system insures constant feeding. Material may be processed with multiple passes, according to sample nature and technician decision, in order to recover an adequate heavy mineral preconcentrate and a reject which is discarded. Approximately every ten samples, rejects are recovered, dried and process for recovery control (**appendix 3, table 1**). A 100 to 200 g aliquot of the slime is also recovered, except for sandy sample, dried and stored, pending to be shipped to the client or laboratory for chemical analysis.

### SECONDARY SIEVING

The dried table preconcentrate is sieved dry at 250 microns (**appendix 3, table 1**). Fine fraction <250 $\mu$  is dedicated to a secondary gravity concentration while coarse fraction >250 $\mu$  was stored. Sieves are clean in ultrasonic bath between each sample.

### SECONDARY GRAVITY SEPARATION

The <250  $\mu\text{m}$  preconcentrate is submitted to second gravimetric separation in order to obtain a heavy mineral concentrate with a constant weight of 30-50 g. It is known that 98% of gold flakes are <250 microns, and are recovered at >95% by such process. The Falcon SB-40 concentrator is centrifuge calibrated to retain dense fine particles with a force of 60 G and water pressure of 2 psi (**appendix 3, table 2**). Heavy mineral concentrate is dried for subsequent magnetic separation or visual examination. Utmost precautions are taken to avoid contamination at this level. Recoveries can be calculated from mass balance.

### HAND MAGNET SEPARATION

Magnetite and other ferromagnetic minerals are removed from the concentrate with a hand magnet (**appendix 3, table 3**). Special care is applied to this step since any trace of magnetite will tend to obstruct the Frantz separator. Ferromagnetic concentrates, dominated by magnetite, were stored pending client decision.

### FRANTZ MAGNETIC SEPARATION

The non-ferromagnetic heavy minerals are split into various fractions based upon their apparent magnetic susceptibility with a Frantz LB-1 field barrier magnetic separator. Forward and slope angles are set at 15°, and the concentrates were process at various current intensities (**appendix 3, table 3**). A minimum of 1 g of material is required to proceed with magnetic separation. Gold is typically concentrated, along with pyrite, in the diamagnetic fraction.

## QUALITY CONTROL FOR HEAVY MINERAL PROCESSING

Quality control regarding heavy mineral concentration has been monitored only by the use of mass balances. For such, initial material is weighted and compared to the sum of weight of all subsequent fractions. This method allows detection of sample inversion, material losses and gains. Tolerance thresholds are calculated from the sum of weighting accuracy, and taken as +/- 3 g for secondary dry sieving, +/-0.06 g for magnetic separation (*appendix 3, table 3*). Tolerance threshold for wet sieving is complex to evaluate, since mass loss originates from desliming of the mud, while mass gain originates from interstitial water in sieved material, which is weighted wet.

- Primary wet sieving is the least robust step, since mass losses are typically important due to elutriation of mud, as well as mass gain due to interstitial water retained by <1 mm fraction. Mass gains shall not exceed 10% of initial weight for a normal till, while mass losses can reach 50% of initial weight. No problem has been detected at this step.
- Mass balance for shaking table cannot be calculated since lights were not saved and coarse (250-1000 µm) fraction was not processed. The material was largely dominated by sand and most samples were free of clay.
- Mass balance for secondary dry sieving is within tolerance of +/- 3 g.
- Falcon's gravity separator indicated significant mass losses for some sample (up to 14 g). According to technician, light minerals and muds are lost in course of processing, procedure which will have to be improved for subsequent projects. Two discrepancies were noted for 73820333 and 73820399 due to manipulation error on light mineral fraction. No mass gain or heavy mineral loss was noted (*appendix 3, table 2*).
- Two discrepancies were noted at the magnetic separation. Samples 73820256 and 73820618 are above the tolerance threshold, with a mass loss of 0.90 g and 0.11 g, respectively. Material lost for these samples was reported due to manipulation error.

Other processing controls used for concentration of kimberlitic indicator mineral were not implemented for this batch of sample. Zirconia beads, which is commonly use as spike, has been introduced at >250 microns fraction in spite of no mineral examination was anticipated. Mineralurgical balances for the shaking table were not accurately calculated since no mineral examination was anticipated. No duplicate, blank or standard material is introduced amongst samples.

Project	Sample ID	Sample description		Primary Wet Sieving			Grain size		Wifley table		Secondary dry screening

Sample description	NOTES AND GENERAL COMMENTS
Sample ID	
73820007	Échantillon avec un peu de siltSable rosé, matière organique, inclinaison 7,8°
73820069	Échantillon avec un peu de silt et d'argileSable brun rosé, au début 3cm d'argile, matière organique, inclinaison 7,8°
73820118	Échantillon sableuxSable rosé, beaucoup de magnétite, pas de boue, inclinaison 7,8°
73820127	Échantillon sableux, grossier, compact et silteuxSable brun, au début 2 cm d'argile, inclinaison 7,8°
73820135	Échantillon sableux, grossier et avec du siltSable beige, inclinaison 7,8°
73820142	Échantillon sableux, grossier et avec de la matière organiqueSable brun roux, matière organique, remonté le matériel à la main, très grossier, pas de boue
73820163	Échantillon un peu sableux et silteuxSable, au début 2 cm d'argile, matière organique, inclinaison 7,8°
73820177	Échantillon silteux, un peu de sable et d'argile et semi-compactSable, matière organique, inclinaison 7,8°
73820198	Échantillon sableux et silteuxSable brun, au début 3 cm d'argile, matière organique, inclinaison 7,8°
73820199	Échantillon sableux et silteuxSable brun, beaucoup de magnétite, pas de boue, inclinaison 7,8°
73820206	Échantillon sableux avec du silt et de l'argile, compactSable brun, inclinaison 7,8°
73820217	Échantillon sableux, grossier et avec du siltSable brun roux, matière organique, remonté le matériel à la main, échantillon argileux

## APPENDIX 4: PEBBLE VISUAL EXAMINATION

### PEBBLE VISUAL EXAMINATION      VIII

*Table 1: Pebble visual examination*

## PEBBLE VISUAL EXAMINATION

Pebbles, recovered from samples for which heavy minerals were submitted to analysis, were visually inspected for the presence of mineralization by S. Lavoie, geologist in training. These 17 samples are all similar, overwhelmingly dominated by granitoids, with lesser volcanics and sediments (**appendix 4, table 1**). No significant mineralization was noted.

SAMPLE	POIDS (kg)			LITHOLOGY									
	1-4 mm	4-9.5 mm	> 9.5 mm	Metavolcanic	Metavolcanic intermediate	Granite	Granodiorite	Tonalite	Monzonite	Diorite	Mudstone	Metasedimentary

## APPENDIX 5: MUD ANALYSIS

<b>MUD ANALYSIS</b>	X
<b>Analytical quality control</b>	X
<b>IOS controls</b>	X
<b>ALS Chemex controls</b>	XI

**Table 1:** Mud analysis

**Table 2:** Quality control: SE29 certified reference material analysis

**Table 3:** Quality control: Quartz analysis (internal reference material)

**Table 4:** Quality control: Certified reference materials and blanks analysis  
(ALS Chemex)

**Table 5:** Quality control: Replicates analysis (ALS Chemex)

**Table 6:** Certificates of analysis

## MUD ANALYSIS

Muds recovered from the Wilfley table from a subset of 12 samples were submitted for geochemical analysis (**appendix 5, table 1**). This mud represents the slimes, typically <63 $\mu$ , which is washed and recovered from the Wilfley table, dried and stored. They were submitted to ALS-Chemex for an ICP-OES analysis, after Aqua Regia digestion (ME-ICP41). This analysis has been used routinely in our heavy mineral concentration process and large database is available to the author for comparison. The method has been proven as efficient to detect glacial dispersion for elements not partitioned into silicates, such as metalloid (As, Sb, etc). Gold was been assayed by fire-assay with ICP-MS finishing (Au-ICP-21).

## ANALYTICAL QUALITY CONTROL

Quality control of analytical results is a complex process involving various approaches. Quality control was done by IOS upon reception of results, and by the geochemistry laboratory in the course of the analyses. Controls included insertion of blanks of quartz, replicates, control materials, etc, each with its specific purpose. No analytical problems were detected for the mud analyses.

### IOS CONTROLS

Certified reference material (SE-29) was introduced as samples. This material was product by Rocklabs and known for its stability. It is a gold reference material and the certified value for gold is 0.597 ppm. Results are provided in **appendix 5, table 2**.

Placebos (sample blanks) were introduced as samples (**appendix 5, table 3**). These were prepared from clean high purity grenvillian quartz, pulverized with a carbon steel plate pulverizer (Bico-Braun), sieved at -170 meshes and thoroughly blended. Considering the low detection limits allowed by ICP-MS, this placebo appears not to be totally blank. It also bears significantly contamination from grinding plates:

- 1.15% iron
- 14 ppm nickel
- 20 ppm copper
- 25 ppm molybdenum
- 0.5 ppm tungsten

The presence of chalcophile elements is also observed, the source of which is unexplained. These metals and metalloids were certified as being absent in the quartz in previous analyses using other methods. The following grades obtained are constant but higher than the ones obtained for other reference materials or samples:

- 20 ppm copper
- 0.5 ppm arsenic
- 0.2 ppm antimony
- 1.4 ppm tin
- 2 ppm lead

#### ALS-CHEMEX CONTROLS

ALS Chemex analyzes and reports a blank solution and a set of certified reference material (GAu-11a, GBM3961c, GPP-01, MRGeo08, OxA71, OXD73, PGMS-16, PK2, SL34 and ST-252) analysis in each analytical run (**appendix 5, table 4**).

ALS-Chemex routinely reruns ICP-MS analysis every 7 samples. These replicates involve separate digestion, but are run sequentially within the same analytical batch, and shall be taken as an indication of analytical precision. ICP analyses were replicated for only 1 sample in this project and fire-assay analyses were not replicated. (**appendix 5, table 5**).

Certificates of muds analysis and their quality control are provided in (**appendix 5, table 6**).

## APPENDIX 6: GOLD GRAINS EXAMINATION

VISUAL EXAMINATION XIII

*Table 1: Gold grains examination*

## VISUAL EXAMINATION

Visual examination for gold is performed by trained earth scientists under Leica MS5 polarizing episcopic stereomicroscope. Samples from this project were sorted by Mrs. Natacha Fournier P. Geo and Sanmei Gao, M.Sc. Birefringence is tested with the use of a Leica M3C polarizing diascopic stereomicroscope and a Wild M-21 wide field petrographic microscope. Gold, sulphide or other selected minerals are extracted and stored on specially designed glued boards. Each gold grain extracted is sorted by shape and morphology.

Mineral sorting results are presented in **appendix 6, table 1**. The heavy mineral concentrates were stored pending client decision.

Due to the large volume of heavy concentrates, and tidiness of <250 µm fraction visual examination, only part of the concentrates were sorted, preferentially the diamagnetic fraction.

# HEAVY MINERAL CONCENTRATE ANALYSIS

## ANALYTICAL PROTOCOL

A set of 17 fine heavy concentrates, used for gold visual identification, were submitted for assays. For such, the various magnetic fractions produced for the visual exam were concatenated. However, gold grains, extracted in the course or visual examination, were not returned into the concentrate. Reconstituted samples were sent to ALS-Chemex, pulverized with an agate mortar, and submitted for ICP-MS analysis after multiacids digestion (ME-MS61), plus a fire-assay with ICP-MS finishing for gold analysis (Au-ICP21). Results are listed in **appendix 10, table 1A**. No analytical problems were detected for the heavy mineral concentrates analysis.

## ANALYTICAL QUALITY CONTROL

Analytical quality control for heavy minerals concentrates are carried by the laboratory and also by the introduction of control material by IOS:

- Concentration factors and metallurgical recuperation are calculated for approximately 18% of samples. To do so, an analysis of 3 rejects (light) from Falcon concentrator has been done (**appendix 10, table 1B**), which one is weighted according to weight recovered. The gold recovery is difficult to establish whereas the proximity of the detection limit, as nugget effect. Hafnium is consequently used because it is a tracer for zircons, it is the more dense element and it is easily quantifiable. The hafnium, for this project, indicates concentration factors about 7.5x and a recovery quite stable at 39%. Considering the high concentration of heavy mineral in sample 73820234, it could not be used for these calculations. Results are provided at the **appendix 10, table 2**. It has been observed that the recovery increases drastically with the density of the minerals. Gold, with a density between 12 and 17 g/cc, is normally recovered at 95-98% with this device.
- Internal reference material, the MRIMIL06, has been introduced only one time in the sample sequence. This material corresponds to a heavy mineral concentrate, chalcopyrite and sphalerite-rich, adequately homogenized (**appendix 10, table 3**).
- Sterile samples ("blanks") have been introduced in the sequence only one time. The sample shows gold grade higher than the expected value, but still low, and also shows other minor variations than the expected values (**appendix 10, table 4**).

- Similarly to previous point, the laboratory introduces sterile solutions (blank) and certified reference materials for gold and for the ICP-MS (**appendix 10, tables 5A and 5B**), which do not detect any contamination by dissolution and determination. Analysis show values inside the tolerances for significant elements. Five reference materials have been used for the quality control for gold analysis (Blank, GPP-01, PGMS-16, OXD-73 and OxA71) and two for the analysis by ICP-MS (Blank and GBM3961c).
- The laboratory replicates some analyzed samples for gold and for the ICP-MS (**appendix 10, table 6A and 6B**). One (1) sample has been selected for gold and one (1) for the ICP-MS. The sample for gold did not contain enough material to allow a second analysis. As for the sample analyzes by ICP-MS, the analysis show a good correlation for the major elements.

Certificates for heavy mineral concentrate analysis and their quality control are provided in (**appendix 10, table 7**).

8-DEC-2009  
Compte: GROAGN

## CERTIFICAT VO09121021

Projet: 738

Bon de commande #: 11687

Ce rapport s'applique aux 23 échantillons de concentré soumis à notre laboratoire de Val d'Or, QC, Canada le 29-OCT-2009.

Les résultats sont transmis à:

LAURENT EUSTACHE

KAREN GAGNE

REJEAN GIRARD

## PRÉPARATION ÉCHANTILLONS

CODE ALS	DESCRIPTION
WEI-21	Poids échantillon reçu
LOG-22	Entrée échantillon - Reçu sans code barre
PUL-42	Pulverizer Agate Moulin

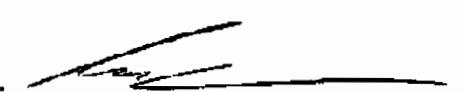

## PROCÉDURES ANALYTIQUES

CODE ALS	DESCRIPTION
ME-MS61	ICP-MS 48 éléments, quatre acides

**Table 7:** Certificates of analysis

## BULK SAMPLES ANALYSIS

### ANALYTICAL PROTOCOL

Samples collected for geochemical analysis only (2.5 kg) were delivered to ALS Chemex Facilities, in Val-d'Or by the crew on their way home. These samples were analyzed using a bulk cyanide leach method, which allows for the determination of cyanide extractable gold in large ( $\leq 3$  kg) soil and sediment samples. The use of large sample weights allows for good sampling statistics and counteracting the nugget effects. The leached liquors were analyzed with ICP-MS methods, enabling low sub-ppb detection limits for gold and silver, as well as ppm levels for arsenic, copper, zinc and molybdenum.

The sample is weighed, dried and crushed, without removing the pebbles, to 70% less than 2 mm (Tyler 9 mesh, US Std. No.10 screen). A split of up to 1000 g is then pulverized 85% less than 75 micron mixed with a dilute alkaline sodium cyanide (0.5%) solution (in the presence of lime), and rolled for a minimum of 12 h. Gold is extracted from the liquor with DIBK and can checked by AAS. Gold, copper, silver were determined by ICP-MS, while arsenic, zinc and molybdenum were analysed atomic absorption spectrometry (AAS). Cyanide leach analyses are reported in **appendix 11, table 1**.

### ANALYTICAL QUALITY CONTROL

Quality control of analytical results is a complex process involving various approaches. No historic data and statistics were registered for cyanide leach method. Quality control was done by IOS upon reception of results, and by the geochemistry laboratory in the course of the analyses. Controls included insertion of blanks of quartz, replicates, control materials, etc, each with its specific purpose. Values highlighted in yellow represent quality control which exceed  $2\sigma$  errors, or below 95% confidence, based on results of this project. Values highlighted in orange are  $3\sigma$  errors, or below 99% confidence. When a control material shows a discrepancy, samples before and after this control material are susceptible to show a similar discrepancy. Therefore a warning shall be issued for all samples preceding and following samples up to the next control material without such discrepancy, or a re-assay requested at the lab.

## IOS: INTERNAL REFERENCE MATERIALS AND BLANKS

An internal reference materials ("standards") and as well as blank material were prepared and inserted among the samples (Till09, Quartz blank). This IRM was prepared by mixing sandy silt samples, thus providing material with rigorously identical matrix to the collected samples. These IRM were inserted among samples in the current project. This material has been doped with gold-bearing certified reference material in order to bring it grade comparable to the expected samples.

Material Till09 has been inserted 44 times and is listed in **appendix 11, table 2**. Following discrepancies were noted:

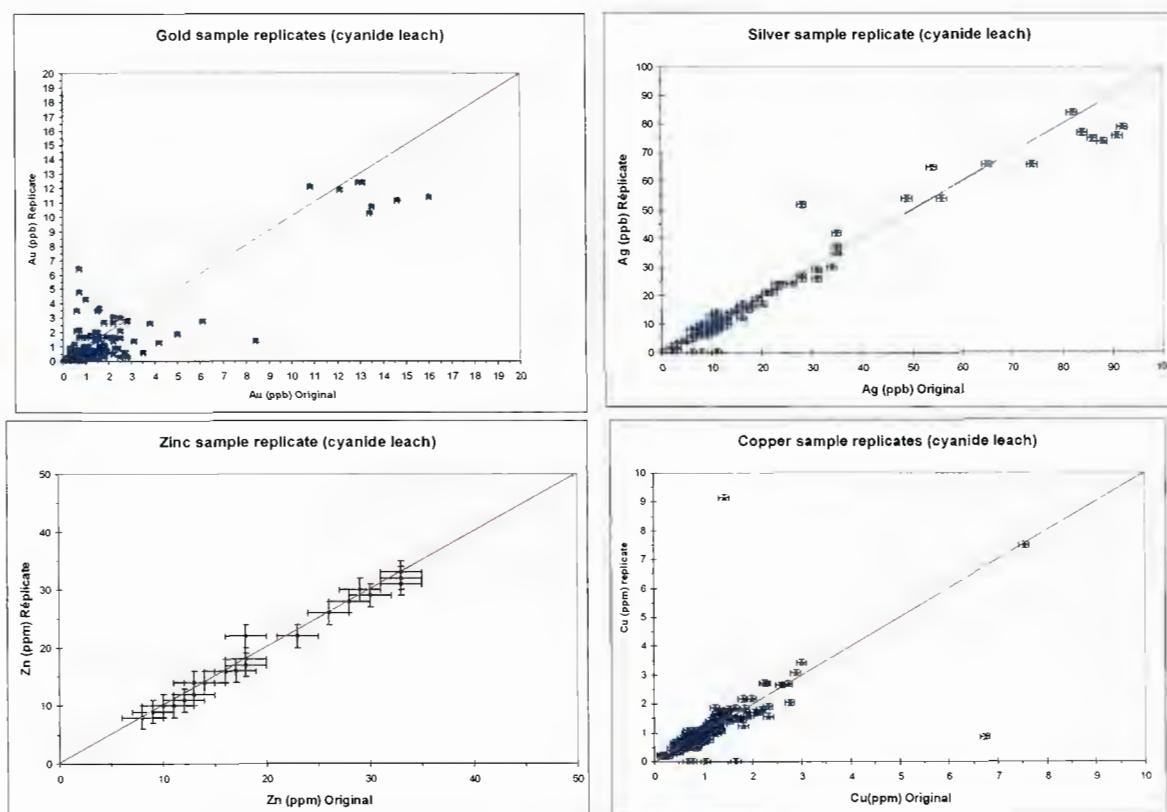

- Samples 73820620 and 73820640 (gold) show respectively a standards deviation  $> 2\sigma$  and  $> 3\sigma$  for gold. These discrepancies are considered as no significant. No analytical problem or similar discrepancies on preceding or following samples are detected. However, as requested by client, sample 73820640 was reanalysed but the replicate showed lower values for gold, copper and silver than first analysis.
- Copper element presented a standard deviation  $> 2\sigma$  for sample 73820460 and  $> 3\sigma$  for samples 73820190 and 73820250. These discrepancies are considered as normal, copper ICP assays being generally unstable.
- Quartz blanks were inserted 22 times and results are listed in **appendix 11, table 3**. Following discrepancies were noted:
  - Samples 73820420 shows a standards deviation  $> 2\sigma$  for gold.
  - Sample 73820460 present a discrepancy  $> 3\sigma$  for Copper and silver.
  - Inverted samples were detected: Sample 73820459 was inverted with blank 73820460 and sample 73820499 was inverted with 73820500. Samples batch related this both discrepancies from 73820426 to 73820525 were reanalyzed (certificate VO09071668) and corrected. No others discrepancies were noted or detected.

## ALS-CHEMEX: BLANKS, CERTIFIED REFERENCE MATERIALS AND REPLICATES AND REANALYSES

ALS Chemex analyzes and reports a blank solution and a set of certified reference material (G2000, GBM3961c, GBM398-4c, GBM999-5, MP-2, ST-289 and ST-381) analysis in each analytical run. The results and their statistics are provided in **appendix 11, table 4**.

Some discrepancies were noted for Blanks solution: an anomalously high value for gold and five unusual values for copper. Contamination problem ("memory effects") is suspected on ICP-MS analysis. No particular problems were detected for others reference materials inserted by ALS Chemex.

ALS-Chemex routinely reruns ICP-MS analysis every 7-15 samples. These replicates involve separate digestion, but are run sequentially within the same analytical batch, and shall be taken as an indication of analytical precision. In this project, samples reanalyses were requested by the client or IOS due to suspected analytical discrepancies (**figure 14**). Cyanide leach analyses were replicated for 66 samples (**appendix 11, table 5**) and 97 samples were reanalysed (**appendix 11, table 6**).

**Figure 14:** Correlation diagrams between analysis and their analytical replicates or reanalysis for gold, silver, zinc and copper. Notice two samples (73820541, 73820558) which shows offset values in copper. Error bars represent detection limits.

Precision on measurement for silver appears to be within usual 10% tolerance expected for ICP-MS. Only one discrepancy in silver is noted for sample 73820498. Gold distribution diagram shows a significant nugget effect. Two obvious discrepancies in

copper are noted for sample 73820541, and 73820558 for which a nugget effect is suspected. Notices that copper are notoriously difficult to achieve precise assays by ICP, typically +/- 15%-20%. No analytical problem is detected for zinc which was analysed by AAS.

Certificates for bulk samples analysis and their quality control are provided in (**appendix 11, table7**).

## CERTIFICAT VO09072020

Projet: 738

Bon de commande #:

Ce rapport s'applique aux 107 échantillons de sediment soumis à notre laboratoire de Val d'Or, QC, Canada le 15-JUIL-2009.

Les résultats sont transmis à:

LAURENT EUSTACHE  
MIRELA SARACI

KAREN GAGNE  
PATRICE VILLENEUVE

REJEAN GIRARD

## PRÉPARATION ÉCHANTILLONS

CODE ALS	DESCRIPTION
WEI-21	Poids échantillon reçu
PUL-21	Pulvériser échantillon entier
LOG-22	Entrée échantillon - Reçu sans code barre
DRY-21	Séchage à haute température

## PROCÉDURES ANALYTIQUES

CODE ALS	DESCRIPTION	INSTRUMENT
Mo-AA45	Trace Mo - Aqua regia /AAS	AAS
Zn-AA45	Trace Zn - Aqua regia /AAS	AAS
Au-CN12	BLEG 1 à 3 kg, flacon	ICP-MS
As-AA45	Trace As-Digestion Aqua regia	AAS
